Thanks for the input. I am definitly leaning towards this tuner. Are you powering it off the FP30/internal batteries or a seperate power supply?

Gary, the fact that you mentioned that the rig is noisy on both
antennas would seem to indicate that you're picking up RF noise from
an external source. As someone else has mentioned the way to
determine if the noise is generated by the radio is to disconnect the
coax from the back of the rig. At that point you will hear
essentially just the 'white noise' generated by the rig itself. My
experience is that while the 897D isn't as quiet as, say, an
IC-756ProIII it is at least as quiet as comparable rigs and in many
cases it is better. I don't find the self-generated noise to be a
problem at all. It's quite likely that you're hearing a noise source
near your QTH. For example, I recently tried to operate portable from
a hotel room and found that in that vicinity there was a 20dB/S9 noise
across the entire HF spectrum (and at least part of the VHF range as
well).

HELLO MATT. YOU MUST POWER THE AT100PRO OFF A
SEPARATE SOURCE. I THINK LDG SUGGEST THIS IN THE
LITERATURE IT DRAWS SEVERAL HUNDRED MILLIAMPS WHEN
TUNING BUT THEN RETURNS TO SLEEP MODE, I REALLY THINK
THIS COMBO IS YOUR BEST CHOICE. 73'S DENNIS--- Matt

16713. Re: ALC setting

Yahoo group: FT897 (2007)
Date: 2007-01-01 12:47:13 UTC
From: Jochen - DG2IAQ
Topic: 16697 Message: 16713

Hi Wayne.

For me it sounds like RFI problems, maybe produced by your ATAS-120. Just try a RF choke at the base of your ATAS. A RF choke is NEVER wrong, ..hi.

For example one like these:
http://www.db8bx.de/korrek.htm?page=ant01.htm

Your ALC problem sounds for me that either the SWR is bad or you have RFI straying problems. Maybe you could switch from ALC to MOD display. I'm sure you will see a raising MOD level meter if these problems occur !!

I had the same some days ago as I used an external DAIWA MC-220 mic compressor on my FT-897D at home (but on an invisible remidy antenna system, mounted UNDER the rooftop of the house). The problem was that I easily connected the MC-220 to the DC power supply of my FT-897D instead of using a separate (and therefore RFI isolated to the FT-897D) one.

73,
Jochen (DG2IAQ)

From: webfootwandere
Topic: 16700 Message: 16714

Matt-

I have the FT-897D w/ FP-30 power supply; the LDG Z-11 Pro tuner w/ the Y-ACC cable; a MicroHam USB II interface to the laptop and soundcard; HRD for CAT software. Absolutely zero problems with this setup. The station goes portable to our motor home very nicely. Not a contest rig, but a DC to daylight all mode workhorse. And a nice plus - scan the forums and you'll see that HRD, LDG, and MicroHam have absolutley great and immediate support!

On the Z-11 Pro, I put batts inside per the manual - the Y-ACC does not provide power from the FT-897. This tuner has memories for 4 seperate antennas (2000 each) but only one ANT jack. If you run multiple HF antennas, put the LDG DTS-4 after the tuner and you're set.

I don't work sats (HOA and CCR's that aren't antenna friendly) so can't shed any light there. Good luck with your new rig, whatever you decide. Get out there in HF land and enjoy. The whole world is yours - even now - and propagation should only gets better for about the next 10 years!

73, and Happy New Year!

AI4LG - Rick

16715. Re: Almost ready to buy...but with a few questions still

Dear Matt~~

897 is a nice rig; excellent for both base and (to some extent)
field work -- but beware; the front tuning knobs are somewhat
fragile and can break.

1)I have older 897 non-D model which I prefer as I can
wideband the rig with software vs hardware mod

2)The FC-30 tuner - which I have- is useless. Get the LDG 897
so you can bolt it to side of rig.

3)897 with internal batteries and attached tuner is heavy.
Although I took it to Katrina & Wilma, I won't again and
will take my light 817 with amp instead. If you really
want full-power portable ops, consider 857

4) I run Ham Radio Deluxe via CAT cable, no problems. Also
use Rascal, no issues, via USB. Be sure to order the whole RASCAL
and select the free RMDIN plug to go with the 897. If in doubt,
call them. Re Accessories, I also have the big MD-200 studio
microphone; very nice.

5) Service-- this is important and Yaesu service did
a great job for me on both my 897 and 847.

Good luck!

16716. Re: Additional input for mic?

Yahoo group: FT897 (2007)
Date: 2007-01-01 16:41:15 UTC
From: Rob, WB1AEX
Topic: 16707 Message: 16716

Hello Leeds,

I believe the data input in the back is only selected as an input when the rig is in "Digital" mode. I have had the frozen mode and band freeze issue several times. In each case, it was due to the cw plug not being fully inserted in the back of the rig, causing the rig to sense that the cw key was closed, or something on my desk was actually pressing against the cw key and closing the keying circuit. I believe the 897 will come up in this limited (frozen) mode if there is a chance that the radio may be turned on in transmit mode. Someone else may have another theory, but that is what I have seen!

73,

Rob WB1AEX

I have the FT897 (late model non-D version) and it has been a real trooper. It does very well as a base station rig, and I have used it extensively on my boat in portable mode. The receiver is remarkably good, and I really like the layout of the rig. It is a solid performer.

My best wishes for A Happy and a healthy New Year to all.

The following Yaesu equipment is for sale.

Yaesu FT 1000 Mark V Field

1. This unit has a factory 0.5 PPM TXCO which meets NTIS/MARS requirements
2. This unit has been professionally modified to work on MARS frequencies (1.8-30 MHz) both receive and transmit
3. Unit has the original Filter set 6.0Khz, 2.4Khz and 500 Hz Collins filter
4. There are also the following Inrad Filters 2.1KHz (8MHz IF), 2.1 Khz (455KHz IF) and an additional 500Hz filter
5. Units comes with the SP-8 Speaker with audio Filters (Supports two units)
6. There is a built in Yaesu Phone Patch unit in the speaker
7. Nifty Mini-Manual
8. Unit includes Heil Headset adapter
9. One owner non-smoking
10. Physical and electrical condition is excellent
11. All original manual, schematics and documents
12. Original packing
13. Shipped prepaid via UPS/FEDEX or DHL within the lower 48 states
14. Asking $1675 Cashiers Check (Exact Amount)
15. Contact Barry aa7zc@...
16. Picture available on E-Ham classified

Yaesu FT-897D

1. Internal AC Power supply (FP-30)
2. This unit has a factory 0.5 PPM TXCO which meets NTIS/MARS requirements
3. This unit has been professionally modified to work on MARS/CAP frequencies, both receive and transmit in addition to the normal range.
4. Unit has original filter set
5. Unit has addition Inrad filters of 2.6 KHz and 2.0 KHz
6. Units includes LDG AT-897 Antenna which is attached
7. Unit has LDG FT meter
8. Unit has Yaesu mobile speaker
9. All original documents
10. N6FN Nifty! Manual for the FT-897D
11. One owner non-smoking
12. Physical and electrical condition is excellent
13. Original packing
14. Unit used as a backup to base station rig-little use, never mobile

15. Shipped prepaid via UPS/FEDEX or DHL within the lower 48 states
16. Asking $950 cashiers check (Exact amount)
17. Contact Barry aa7zc@...
18. Picture available on E-Ham classified

Have a great year!

Barry

16719. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2007)
Date: 2007-01-01 21:21:59 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 16719

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

16721. 897 vs. 857

Yahoo group: FT897 (2007)
Date: 2007-01-01 21:00:12 UTC
From: Lee Mairs
Topic: 16721 Message: 16721

I am trying to decide between these two rigs as a replacement for an IC-725 rig used for mobile and backup for my Navy MARS station. The IC-725 just doesn't hack it as a receiver - much inferior to my IC 751A.

Any observations/suggestions relative to receiver quality between the two Darned if I can see much from the specs...

From: Robert G. Schaffrath
Topic: 16721 Message: 16722

They are basically the same radio except the 857 is in a mobile form factor and has no room for internal batteries or a power supply. I myself have an FT-897D and had a chance to play with an FT-857 this past summer and was equally impressed. I did find the 857 a little more difficult to operate only because the tiny form factor requires extensive use of multi-function buttons.

Lee,

The 897D and 857D are internally the same radio. The external package and knobs are different, but the "motherboard" is the same--it all depends on whether you want a mobile rig or a tabletop model...

Lee,

I have both the 857D and 897D and they are both good rigs. I personally don't think the 897 would make a good mobile but it's a great portable rig. It has more heat-sinking than the 857 so it handles digital modes like psk and pactor better.

You can't go wrong with either rig you just need to decide if you want a mobile or not.

I use the FT897D in my car all of the time.
With a Marine deep cycle battery and an antenna stand,
it works in campsites quite well also.

Not sure what you mean when you say it won't make a good mobile.
Maybe I don't understand what you mean by mobile. Maybe I'm
using it as a portable, not a mobile. or the opposite.

I don't think it would be a good rig to carry backpacking.
When combined with the battery pack, it's heavy and bulky.

I'm not saying the 897 can't be used as a mobile, but the 857 is better suited. I can picture the trouble I would have trying to mount an 897 in my pickup. On the other hand, the 857 is a piece of cake even if you don't mount the faceplate separately.

Lee,

I own an 897D. I chose it after careful consideration of its plusses and minuses compared with an 857, which others have discussed already, and selected the 897 for three reasons:

1. I wanted a rig that I could move between three separate vehicles, AND also use in the home QTH and at a cabin we own in the mountains. I concluded that although the 857 would be easier to mount in a vehicle, it would actually be more difficult to remove and use elsewhere than the 897, if I were using mounting systems I have devised (see below). As a "desktop" unit, the 897 is clearly superior.

2. I prefer the better ergonomic factors and larger knobs and buttons -- the general ease of use -- of the 897.

3. I live in "earthquake country" in Southern California, and I wanted a rig that could operate completely self-sufficiently as an emergency communications rig, no matter where I was or where the rig was at the time of the EQ. The self-contained batteries in the 897 meet that need, at least in a limited way, but with the 857 you need some sort of external power source. I can envision circumstances where even a car battery would not be available (e.g. rig inside the house, car in the garage and the garage pancakes).

Some people view the 897 as too large and difficult to mount easily in a vehicle. I respectfully disagree. I have devised and build plywood mounting bases that position the 897 so that the dials and display are easily visible and accessible to the driver, and also allow me to dismount it and move the 897 between different vehicles. Each of three vehicles for which I've made mounting devices has a different location in the vehicle, and each mount is a different design. But they all work. For a 2003 Saab 9-3, I built a mount that sits in the open glove box and orients the rig to face the driver. (Downside: takes away knee room for front seat passenger.) In my 2006 Prius, the mount straddles the transmission hump, pointed up at about 75°. In my 1975 Pinzgauer (a Swiss Army surplus troop carrier that I use for recreational off-highway driving, and as a platform for a rover station) the mount is bolted to a grab-rail on the passenger side of the dashboard. I have designed these mounting systems so that the rig can be detached in about 30 seconds (including disconnecting the power and coax cables) and remounted in another vehicle just as fast, making it very easy to move from one vehicle to another, or to anywhere else. One could also use commercial radio mounts such as the PanaVise mount (see http://www.cheapham.com/page2.html for pictures and pricing). The only

downside to the PanaVise is that the rig attaches with screws, so moving it from one place to another takes a bit of time. I suppose there's a way to devise a quick disconnect system for use with something like the Panavise, but I haven't put my mind to it to solve the problem.

If there's an expression of interest, I can take some photos of the mounting systems and post them to the photos section. Making these sort of mounting brackets can be done entirely with hand tools, but it's much easier if you have access to basic woodworking tools -- a saber saw and electric drill at a minimum.

16728. CFIL won't disengage

Yahoo group: FT897 (2007)
Date: 2007-01-02 20:11:26 UTC
From: tolhens
Topic: 16728 Message: 16728

Hi,

Here's my first problem with the Yaesu FT-897D. I've enoyed the rig. Some how the CFIL (under menu "n," I believe, won't disengage. There are no filters in the filter slots. I didn't set the CFIL button (the A button) to on.

But there it is. I can't hear audio because the S-Meter pegs.

When I do a boot, (lost all of my memories), the CFIL setting does not go back to default nor can I disengate it.

Ideas?

73s,

Rick

16730. Digital Modes with 897

Yahoo group: FT897 (2007)
Date: 2007-01-02 22:17:01 UTC
From: kc0nro
Topic: 16730 Message: 16730

All,
Here is my dilemma...

I have an 897, Rigblaster NoMic, and a Sony laptop running WinPSKse. I have hooked everything up, can receive signals (PSK31) just fine, but cannot get the rig to transmit. I am interfacing the rig with the NoMic via a serial cable. I have ensured the jumper settings on the NoMic are correct. Even checked the resistor in the NoMic that has been known to cause problems...and I have the right one installed.

Has anyone had similar problems getting their 897 to transmit in a similar setup? I am leaning toward a laptop port issue at the moment, but am stumped. Ideas???

Many thanks in advance,

JOHN

Hi Lew,
I use my 897D in my F150 pickup. I have a "pedestal" mount and a homebrew mobile mounting bracket. The pedestal is set with the radio at about the same 75 degree angle, and tilted slightly toward the driver. I chose the 897D over the 857 mainly due to the display and knob size. The 857 is just too small for my taste. And since I drive a pickup, I have the room for the larger rig. [10 or 15 years ago the 897D would have been considered very small!]

I would like to see your photos!

Hi,

I still don't get it. The CFIL indictor is enclosed by parantheses.
I cannot turn it off although I have no filters on menu "p" or
whatever it is.

The audio is very narrow and distorted.

Ideas?

From: Bruce Wilson
Topic: 16728 Message: 16733

The rig has places for two physical filters and one digital filter. The ceramic filter (2300 Hz wide) is the provided physical filter, and the digital filter is highly configurable. If you have not installed a second physical filter then the CFIL setting will always be turned on. The unit will not operate if you remove all filters, as they are serial in the signal path. I can imagine you might replace it with a transformer (to keep the input and output impedances matched properly), but you don't want to run with no filter at all. That lets all frequencies into the IF and it would overload so that any signal you want to hear would have no volume at all.

Since ceramic filters very rarely go bad, the suggestion is that you look elsewhere for the difficulty. The digital filter has settings for the how cutoff frequency and the high cutoff. Listening to AM broadcast you can leave it at 0-6000 (so that only the ceramic filter is limiting the bandwidth), or narrow it to discriminate a single code signal better.

Yep, I just checked mine and the [CFIL] is selected. This is the default and only selection unless you have installed one or more of the filter options. If you have another filter, selecting it will turn CFIL off. The audio must be related to something other than this.

Does your laptop have a serial port or only USB? WinPSK probably
wants to see a Comm port to send the transmit (PTT) signal, and the
parameter must be set accordingly in WinPSK. If you are serial-less
and don't have a USB-serial converter, try putting the 897 in VOX
mode. That way the packet audio will key the transmitter.

I use a Heil pro-set plus on my 857D. I run a Mirage B 2516G behind it. I aslo have the cat cable hooked up to my computer so I can run Ham radio deluxe. What cable can I use to key up the amp for SSB? Were can I get one? What is the good way to use them together? One more thing. What menu number is it that I can ajust the volts so I dont get the power spikes when I key up on AM or on SSB? I read on Mods Dk that it should be set at -3.1 volts. I dont use my Mirage that much but I dont want to burn anything up.

I've used the IC 725 (smaller but a lousy rece4iver) and the IC 751A
(tremendous radio, but the passengers won't fit up front). I'd think
that even the 897 wouldn't be all that hard. But clearly the 857 would
be easier except for the smaller buttons.

Hello Bill,

Go to http://www.g4hfq.co.uk/mmohelp/mmohelp.htm

Don't know if it is any good as I have not used it but it seems to be the only one around. I am hoping that the programming function will eventually be included in HRD (Ham Radio Deluxe).

I would definitely be interested, along with many others in the group I am sure, in your evaluation of it. I have spent some time researching what CAT commands are required in order to program memories. If you look in the FT-897 manual it becomes evident that there is no documented support for reading and writing memories via CAT. In order to access the memories, you need to utilize the undocumented EEPROM read/write commands AND basically take your radios life into your hands. Reading the EEPROM is okay but incorrect writing can foul up the radio pretty quickly if not done correctly. I am sure the authors of the various programs that support memory writing had a few mishaps along the way.

IF you are lucky enough to own a Mac instead of a Windows machine,
try DogPark Software's MacMemoriesManager. See

http://www.dogparksoftware.com/MacMemoriesManager.html

Their logging program, MacLoggerDX, is not just the best Mac logging
program on the market, it's the best logging program, period. I know,
because I have tried most of the "recommended" Windows versions. None
are as easy to use as MacLogger.

Yes, exactly. All these highly-featured CAT applications work beautifully until the programmers of the firmware change the memory mapping one day. Then a lot of new rig owners will cry....

Subject: [FT897] Re: Software for the FT897 ? ?

I would definitely be interested, along with many others in the group I am sure, in your evaluation of it. I have spent some time researching what CAT commands are required in order to program memories. If you look in the FT-897 manual it becomes evident that there is no documented support for reading and writing memories via CAT. In order to access the memories, you need to utilize the undocumented EEPROM read/write commands AND basically take your radios life into your hands. Reading the EEPROM is okay but incorrect writing can foul up the radio pretty quickly if not done correctly. I am sure the authors of the various programs that support memory writing had a few mishaps along the way.

...maybe that is why the authour of HRD will only include the memory controls in HRD if someone donated an FT-897 for him to play with in order for him to figure it all out. Kind of makes sense (hi)

Before you part with any hard earned (or otherwise) cash, have a
look at g4hfq's offering. I haven't tried the FT897 software as
yet, but have used his FT8900 software and that is vastly superior
to the RT Systems offering.

Bob g4hfq is also good at incorporating modifications to his
software - I made a suggestion and within a couple of days I had a
modified version to try, within two weeks, it made it through to
the production version.

Other than the above, I have no connection with g4hfq.

Hello Geoff,

I tried the FTBasicMMO software previously and I was not a happy chappy. The unregistered package kept bombing out at a certain point.....and at that point I bombed out too and decided to find something else. I have just purchased the RT package.

However, I will give you the benefit of the doubt and download the newest version of FTBasicMMO and try again. If the second experience proves to be better than the first, then maybe I will buy that package too and give them both a good thrashing....and then give feedback to the group.

I still wish HRD would incorporate the memory management feature into the HRD software.....I'd donate gladly to the cause.

AFAIK, the demo package has certain functions restricted. As I
said, I have not used the FT897 software, only the FT8900.
However, may I suggest that you talk to Bob, I found him to be
very helpful, especially to those users - like me - who failed to
read the most basic instructions.

Incidentally, the software determines the model of the radio. This
may include the software version and thus presumeably reduce the
possibility of writing to illegal memory locations. Bob's web page is
<www.g4hfq.co.uk> email or his email is <bob.freeth@...>.

To get full functionality of FTMMO you have to register it for a mere
?10.
The trial version doesn't allow you to connect to a radio.

Hi...

The guys are right. CFIL will be the default with no filters, as for your audio being distorted, I was messing around one night and actually dont know what I did, something to do with the dsp... anyway everybody sounded distorted...I couldnt figure out what I had done wrong...so I did a hard reset. All is well now, everyone sounds crisp and clear.

I hate to reprogram as much as anyone, but a hard reset should clear up the misadjustment and cure your audio problems. Hope that helps. Jay AA9YP

Subject: [FT897] CFIL won't disengage

Hi,

Here's my first problem with the Yaesu FT-897D. I've enoyed the rig.
Some how the CFIL (under menu "n," I believe, won't disengage. There
are no filters in the filter slots. I didn't set the CFIL button (the
A button) to on.

But there it is. I can't hear audio because the S-Meter pegs.

When I do a boot, (lost all of my memories), the CFIL setting does not
go back to default nor can I disengate it.

Ideas?

73s,

Rick

Bill,
I purchased the ADMS-4B (cable + software) from HRO Burbank for $70. It's a little cheaper on-line elsewhare. For a detailed description see http://www.rtsystemsinc.com/ . I am very pleased with the software, as I frequently rearrange and update the radio memory contents, and I don't even bother to program the memories through the radio panel anymore. The RT Yeasu Programmer software also provides radio configuration of other settings that are customarily available via the radio menus.

To get started with my freq database, I copied web page contents into Excel, and deleted the data I did not want. Then copy and paste missing values as necessary to populate the desired fields. Save that as a .CSV file and import to the Yaesu Programmer. I keep old versions of freq db's under different variations of the file name.

The software does a nice job of importing and exporting .TAB and .CSV files. Much like an Excel worksheet, RT Yaesu Programmer can sort the entire table of memory contents by any field (column), or you can sort selected records (rows) only if you wish. I leave a blank row between sections (e.g. 6m freqs vs 2m freqs) and sort them individually after making updates.

The cable has a standard DB-9 serial on one end, and CAT on the other. I use the same cable with FTBCAT and Ham Radio Deluxe. When I use the computer with USB only (no serial) I have very good results using the Port Authority 2 (USB to DB-9 Serial) adapter that I purchased from CablesToGo.com .

Does anyone have a recommendation for a software program that will allow you to populate the memories in the FT-897 via a computer? Does Yaesu sell such a program? Any info would be appreciated -

If you haven't tried it (FTBasicMMO), you should. It's a wonderful program. I have the same program for my FT-7800, and I was able to upload its file into the FT-897. For control of the radio, try FTBCAT which is free from the same author.

FTBasicMMO versus RT Systems ADMS-4B Memory Management Software for Yeasu FT-857 / FT-897

Price:

FTBasicMMO: $18.50. ADMS-4B: $25-00.

FTBasicMMO: What can it do?

URL: http://www.g4hfq.co.uk/mmohelp/mmohelp.htm

ADMS-4B: What can it do?

URL: http://cloningsoftware.com/857demo/mainscreen.html

My first impressions. (notice that I said 'My')

Firstly I wish to retract the statement which I made when I referred to FTBasicMMO, quote "?..it kept bombing out?.." This was un-unfair statement as I only recalled later that I was trying an older, 'pirated' version of the software. There was a valid reason for me trying this version and it had nothing to do with me being a skinflint?but the reason will become clear shortly.

FTBasicMMO: An evaluation version is available for download but for what it's worth, it is really of no real use, one can do virtually nothing with it. If an evaluation version is placed on the web for download, it should be a full, functioning product but with limited capabilities (in order to protect the Authors investment). The current evaluation version does not allow any form of interaction between the rig and the software, hence my reason for trying a pirated version. The name of the product says it all?.. ftBASICmmo. It is just a memory management tool. I need more than just a memory tool. This software may however be cost effective to someone who only has this need. As far as support goes, judging by Group Member comments, this product seems to have good support from the Author.

ADMS-4B: There is no evaluation version for download available, a definite downer, but on the other hand there is a very comprehensive 'blow by blow' of the product on the website, it includes screen prints and descriptions of each function of the software. This however does not help me to test the software on my system before making the purchase. (But then we buy that big software supplier's products without testing their products either (hi)).

ADMS-4B offers more than FTBasicMMO as it is capable of reading / writing / saving the full configuration of the rig including all the menu settings and parameters, hence, I would assume, the price difference. The software offered what I needed. So this it the product I decided to buy. From purchase to install, all went pretty easy. I opted for the downloadable

purchase. I did not stick to the instructions and blew the first CD copy. The instructions says 'do not modify, change or add anything to the CD before burning, it will not work". They were right?.and all I did was give the CD a Label Name! I dropped the label name, burned a second disk and hey presto! As yet I am not able to comment on the support of the product, but I have written to the supplier and have as yet not received any response.

I have not done much with the software but it does what I need it to do and it did it with out any issues. The bottom line: I am very happy with my choice/purchase.

Note: I reserve the right to amend or add comments to my findings (hi)

Oh and I say again "I still wish HRD would incorporate the memory management feature into the HRD software.....I'd donate gladly to the cause."

I would like to point out that FTBasicMMO reads/writes and saves all
of the data that is exchanged during a radio-to-radio clone operation.
This includes all of the radio's settings.

Hello Bob,

Then I must apologise, which I do most humbly. My writing was based on the following:

1) I could never really test the software, so I based it on what I read and understood in the help file under "What can it do"

See....! That is why I had a disclaimer at the end of my mail :-) I guessed that I would have to pull my foot out of somewhere at sometime.

Thanx for the heads up on this particular issue.

Hello Johnny,

Thank you for raising the point in your posting. I will re-visit the wording in the Help file to make it more clear what is going on regarding backup/reload of the rig's memories and configuration.

16763. RX TX gr8 improvement

Yahoo group: FT897 (2007)
Date: 2007-01-04 14:47:02 UTC
From: SV1EEX
Topic: 16763 Message: 16763

Hello everybody es HNY 2007

After some experimentation with some ham folks around hr ,we came to a series of tweaking for our ft-897s. To tell the truth I was never satisfied with the audio reports that I used to get in SSB/HF until the day I gave these settings a try. It seemed to me that I used a moderate-broadcast-quality audio rig especially when I heard recordings from my audio compared to other rigs like FT-1000 etc etc. Just before investing to something like a Heil Mic or other hifi SSB you may consider trying the settings below.

The result seems to improve the audio reports greatly both in quality and signal from mni other stations.

There is also an improvement to the way I hear other stations.

It seems that the improvement in audio clarity is more than significant in HF bands.

I decided to share the settings with the list .

I assume that a part of them may have already been reported elsewhere so forgive me in case of redudancy.

In case someone wants to test them as well I must warn you that my antennas are carefully cut at swr 1:1 and some of the new settings may possibly overdrive the final transistors so I will be not be held responsible if anything goes wrong. My initial target was not to obtain more watts even though the peak power is increased but to make my audio sound reacher with the MH-31.

I have tested theses settings also with mni friends on their FT-857D and they work equally well for the last 7 months. My 857D also works ufb with them without signs of overheating or erratic behaviour.

Before any attempt to modify the values pse keep the old ones to a piece of paper or your favourite spreadsheet on ur computer in case you want to fallback.

First go to the hidden menu:

On the left I have the menu no and on the right the new setting:

51 250
52 250
67 -10
68 +7
24 230

28 230
32 230
45 150
46 150
47 150

press F

Now go to the normal menu and do the same

15 +150
16 +100
17 -100
18 -100
81 90
74 35

Now go to PROCESSOR and always keep it activated !

I will be vy happy to have feedback from you in case you tested them or if you have further improvements to note.

Run a processor?...Eeww...In my HF circle that will get you a good buddy chewing out...It sounds like you are tweaking the rig to operate with the processor on and probably reducing other settings to compensate...a processor can be run some on higher bands but if its reduced then when you need it it won't be there...Are you rag chewing with local guys and what band are you using?

Hey Gary.

Tnx fer reply.I am not into the rag chewing business so I don't prefer the local nets to hang on. I'm rather the cq kind of person !!

My purpose is NOT to operate with processor on but to improve the audio. After tests with the local hams that gave me the settings I gave a try to some hf work mostly on 80,20,17,15m bands and they said that the audio sounded fb.

Also it seems that my "luck" with the pile-ups was improved...

I was also hesitating to enable the processor even if I didn't work DX but the result was all that mattered to me!

Hi all,
New proud owner of FT 897D and trying to interface with Digi 1.
In the manual only jumper settings for the 817.
I think it is the same as for 897 but it works only partially.
Can anyone tell me how to set the jumpers ? Also I think I have too high ALC for BPSk but not sure it is caused by wrong jumpers or missing ones or high stearing by the TX.

Yes I do!
Set the tcvr in "DIG" mode. In menu 040 you find "DIG
VOX" you set it to 20-30.
I don't used CAT cable, I have a simple interface
without PTT command from the PC, which is conected to
DATA socket from the FT897.
Use the instructions from the Operating Manual!

From: kc3vo@aol.com
Topic: 16770 Message: 16771

Number ONE item: For AM with a 100 watt SSB radio, the carrier power should be 25 watts! If you use more than this, the audio will generally suffer, as there will not be sufficient reserve to accommodate modulation peaks.(Many have used excess carrier, only to find they have poor audio)--This is a case where MORE is definitely NOT "Better"---73, KC3VO, Bob Curry

From: Johnny Burroughs
Topic: 16772 Message: 16772

I would like to record QSO's using HRD. I home brewed a cable that I could connect between the data port of the FT-897D and the sound port on my notebook.

The resulting recording of this connection is....total silence. The wiring has been done according to the rig manual and the PC sound card is setup correctly. Any suggestions what to look out for or advice would be greatly appreciated.

PS: Before I get shot down in flames (hi) I know that there is supposed to be some sort of an interface between the rig and the sound card. I would like to know why and what kind of interface is required?

Thank you.

From: Tim MØTHM
Topic: 16773 Message: 16773

Hi all,
finally done it. I have a little program that creatas a virtual com port then talks to HRD alowwing agwpe to key a rig via Ham Radio Deluxes cat commands (this is great for rigs like the FT897 that has no PTT line on the cat port) at the moment it can only create OCM6 or 7 as i only have the demo version of the activex control! so if you wish to have a copy i can give you the link for the activex and e-mail you the .exe.

From: pa3akf
Topic: 16772 Message: 16774

Johnny,

Between my FT897 and my soundcard there is a Signalink SL-1+ interface with a minidinplug and cable (provided bij Signalink) from rigs "Data out" to SL1 + and a CT62 cable between rigs "CAT" to a serial input on the PC. That makes good qso-recording in HRD of the incoming audio of the FT 897. Of course you can't record any outgoing qso-talk. There is no way that you can monitor or tape your own speech from the FT 897.

As you said you don't hear anything, I put a home-made cable from data-out to the entry of my sound card. That one is connected only to pin 4 of data out (9600 Baud) and pin 2 (ground) on the data out; I use that one to process Shipplotter which doesn't work properly via the Signalink.
I could record with this cable only a very, very weak audiosignal in HRD.
So could it be that you have connected pin 4 instead of pin 5 (AF and 1200 Baud) of "data out" to your sound card? If my assumption is right connecting your soundcard to pin 5 and pin 2 will do the trick.
Be sure that you have selected the correct entry (line -in or mike -in) in Windows Record Volumecontrol.

Hpe this helps.

16775. Virtual Legacy Radio, first release

Yahoo group: FT897 (2007)
Date: 2007-01-05 15:24:44 UTC
From: Petr Malý
Topic: 16775 Message: 16775

Hello all,

I released the very first version of my Virtual Legacy Radio software, the CAT software for FT-817/857/897.

More info and download at:
http://ok1fig.nagano.cz/vlr_overview.htm

It is 100% freeware. It uses only standard CAT commands (listed in the user manual). It includes a correct and complete uninstall procedure as well.
I expect your suggestions for new features.

73, Petr, OK1FIG

From: Robert G. Schaffrath
Topic: 16738 Message: 16776

I decided to take the plunge and just sent $18.50 via Plimus for the FTBasicMMO package. Hopefully it will work with the same FT-897D USB interface cable that picked up on eBay and that I am using with HRD. It originally installed itself as COM27 but I was able to it to COM1 so it should be visible to just about any serial IO based program around. After poking around with the cables' software it turns out it uses a Prolific PL-2303 USB to serial chip which is well supported including the newer 64-bit platforms.

For report, I ordered a dust cover from radiocovers.com
I could pay via Paypal, and the cover arrived very quickly to France,
even during this hollidays season.
It's very nice (you have a large choice of colors), and fit perfectly
the rig. A great addition to the shack.
Happy new year to all!

Thank you Karl for a very comprehesive reply. I am however quite sure that I used the correct pins (2 and 5) for the wiring but I will submit to superior knowledge and take another look. (hi)

I only have a mic-in port on the notebook. It is enabled

WILL you do the "excavating" to try to find the commands
for TUNE, IPO and ATT ?

They probably are there somewhere but all yaesu-represenatives
say that the manual says what there are...

If you look at HRD there are some not in the manual
so they probably are to find in there somewhere...

73 de Kenneth.

That information is stored in the EEPROM and can be accessed through undocumented CAT commands. There is a very good website at http://www.ka7oei.com/ft817_meow.html that covers the FT-817 and documents the Yaesu undocumented CAT commands. While the FT-817 is not an FT-897, it is very close. Also at the URL http://www.ka7oei.com/ft817_memmap.html is a map of the FT-817's EEPROM. I did some comparison of it to my FT-897 and quite a bit of it is the same, the biggest difference being the memory offsets being in a different location.

When I have nothing better to do, I may try and do a real side-by-side comparison of the FT-817 map versus my FT-897D's map and document the differences.

From: Robert G. Schaffrath
Topic: 16738 Message: 16784

I spent part of a rainy afternoon yesterday playing with the FTBasicMMO software and I have to say I am very impressed. FTBasicMMO does not manipulate the EEPROM. Instead, you need to put the radio into clone mode and FTBasicMMO emulates another radio in clone mode that you read and write. This is definitely much safer than hacking around the EEPROM and I would guess the worst you could do is corrupt up the memory settings in which case a reset would fix it. I spent a little bit of time loading up thirty memories and setting the alpha-numeric tags on them. It was a pleasure not having to do it from the front panel! I should note that clone mode would not work very well for an interactive application such as HRD since the radio is dedicated to cloning while in clone mode. I suspect HRD, if the author were to try and implement memory manipulation, would have to go directly to the EEPROM.

The USB CAT interface cable I purchased recently from a shop in Hong Kong on
eBay (http://cgi.ebay.com/USB-CAT-Interface-for-FT-897-FT-857-FT-817-FT-100-CT-62_W0QQitemZ110074735336QQihZ001QQcategoryZ48704QQrdZ1QQssPageNameZWD1VQQcmdZViewItem) works fine. The software recognized the "virtual" COM port without any problems.

Hi Again,

Yes, the ADMS-4B also uses the clone mode hence it also does not Manipulate the EEPROM. So I guess the programs are very similar in their operation.

One thing that I would like to know however; does the FTBasicMMO have the facility to allow one to change the values of the rigs menu parameters or does it only save the current values.

Thanx 73,
Johnny

Topic: 16738 Message: 16786

Many years ago I bought Visual Basic to write a CAT programme. It cost three hundred quid and to this day I never got past screen one.

A few months ago I bought FTBasicMMO. It cost ten quid, was set up in minutes and the memories were programmed, reprogrammed and then finely tweeked over the next couple of days.

Support was there from BEFORE the start as my first questions were about the trial version!

I'm so lazy I didn't even want to type in the frequency info and Bob was straight there with help on converting my TH-F7e files.

There were some things I didn't like about the memory sorting (I know some changes have been made already in later versions) but the programme was so easy to use that my requirements (only initial programming and backup)were completely fulfilled in so few attempts that I haven't used the programme enough to even learn it.

What I **THINK** I do know is that Bob clearly states to READ FROM THE RADIO before ever writing to it.

This, I believe, installs all of your radios current menu settings into the .897 file to which you then add your memory info before beaming it back down the pipe. If you don't do it this way the memories appear to programme no problem but your menu settings will be returned to the default values.

At least thats the way I understand it.

It wasn't a great problem for me anyway as all I had changed was the display backlite at that time but the fact that the lite was reset alerted me to the need for a read and all became clear.

So! The programmes really rather good, the price is very good, and the support is excellent!

And remember, this may well only be a memory management programme but there is a seperate CAT programme and that one is completely FREE!

It doesn't get much better than that.

Regards

Re: Virtual Legacy Radio, first release
Petr,
Thank you for making your Virtual Legacy Radio software available. I have looked at it in the simulated connection mode and it looks very good. From the simulation I am not clear on how the graphic frequency display relates to the main frequency display. Perhaps this would be clearer if I had the radio connected. Once you completed graphing a portion of a band how would one go about tuning the radio to a signal that was displayed in the graph?

Also I read the comment from the other member about converting KHz and MHz to KC and MC. Since Hz is now the industry standard for frequency rather than CPS I don't see any need to make a change to your program.

I see I'm not the only one that uses A.M. on the Yaesu. I use mine on 6 meters and when I key up, everyone tells me I have a strong signal but cant hear me that well. I turn the processor on and set it to 100%. Everyone told me it was like night and day when I turned it on. The only problem I need to figure out for A.M. is the spike the radio makes when I first key up. I hope this helps.

I get good reports with my processor off, at 50% mike gain. With power set to maximum, (100 on the user POWER menu) I have about 25 watts carrier power, and my PEAK-READING Bird wattmeter shows 100 watt peaks while I speak into the stock mike. If your CARRIER power is much higher then 25 watts, you will have poor A.M. until you connect the radio to a 13.8 volt supply, and access the SERVICE/ALIGNMENT menu, and set CARRIER POWER to 25 watts. Adjusting otherwise is likely to give DISTORTED audio and/or eventually damage the radio. (It's YOUR radio, do as you please, but now I can say, "I told you so!")-KC3VO

I use one of these with my MacBook Pro.

http://www.keyspan.com/products/usb/usa19hs/homepage.spml

Also works great with my KPC3.

From: john_stlmo
Topic: 16799 Message: 16799

Selling my new FT-897D (about a month and half old) - I guess I'm just too old fashioned - I'm simply not happy with the menu driven system of the radio, although the radio itself (and especially the receiver) is super.

Paid $800 from HRO asking $675 plus a few bucks for shipping. If you're going to buy a 897d get this one and save quite a few buck. With box, manual, etc. Radio is of course like new, no mods (case has never been off), no defects.

Reply to john_stlmo@...

Thanks.

John

16800. RE: [FT897] Re: Virtual Legacy Radio, first release

From: Petr Malý
Topic: 16775 Message: 16800

Hello Doug and others,

The Graph display actually works in two modes. If you don't change the frequency, after 2 sec delay, it starts to show S for the current frequency. This means you have S on Y axis and time on X axis. This can be convenient, for instance, to watch the strength of a beacon.
When you run scan, the "Scan Whole Band", then there is S on Y axis, and frequency on X axis. This way the X axis corresponds to the scale above, incl. any zooming. The graph has a history of 5 values. If a new value is to be displayed for the same frequency, the older value is painted a bit darker. This scan (and watching the Graph) can be convenient to monitor a sparse traffic on bands such as 50 or 144 Mc/s. You don't have to sit at the radio and listen all the time. You just have a look at the Graph from time to time.

Subject: [FT897] Re: Virtual Legacy Radio, first release

Re: Virtual Legacy Radio, first release
Petr,
Thank you for making your Virtual Legacy Radio software available. I
have looked at it in the simulated connection mode and it looks very
good. From the simulation I am not clear on how the graphic
frequency display relates to the main frequency display. Perhaps
this would be clearer if I had the radio connected. Once you
completed graphing a portion of a band how would one go about tuning
the radio to a signal that was displayed in the graph?

Also I read the comment from the other member about converting KHz
and MHz to KC and MC. Since Hz is now the industry standard for
frequency rather than CPS I don't see any need to make a change to
your program.
73,
Doug K0VPL

I just did some checking of the various radio dealer websites and the prices on the FT-897D have shot up. I am now seeing between $769 and $799 with a current Yaesu coupon. Even more startling is the FT-897D Service Manual which was $16.95 is now ranging from $25.95 to $29.95. At the time I bought my radio they were not in stock at $16.95 so I did not get one. Guess I'll be waiting for one to appear on eBay!

I went back in my records and "my bad". Yep, I paid $834.95 at the end of June. It turns out I was confused by the FT-857ND that was $699 and is now $670. I thought the $699 had been the FT-897D special price. The manual is still higher though. Makes me wonder if Yaesu is trying to clean out inventory for something new this Spring.

Time to go get another strong cup of coffee!

Hello Gang:

I have a three month old FT897D. I use it with an MFJ 991 Intellituner. Recently, I have noticed a power output drop to 30 watts maxium on 40 and 80. It seems to also happen on 30.

The rest of the bands are fine. I know the 897 is touchy with high SWR but the Intellituner shows a solid match. I even manually adjusted it to 'tweak' with the same result.

Is this a final issue? Thoughts?

Hello Group,
I just received my new FT897D and after a few minutes using it for the first time, I noticed that the MEM/VFO CH knob is extremely loose. It seems that there is an excessive amount of "play" in the knob. When turning it or pushing it in (as using it as a button), it functions fine and does what it is supposed to do. The only issue I have with it is that it is very loose to the feel. (It can be moved side to side between 1/8 to 1/4 inch each way.) Is this normal on brand new 897D's? Thanks for any help that you can give. I appreciate it.

Date: 2007-01-10 18:56:32 UTC
From: sm2bya
Topic: 16813 Message: 16813

Hello,

Contemplating the purchase of a 897D as a 50+ MHz-capable complement to my FT1000D, but need some rather specific info before I can decide if it is the right rig for my needs:

I have been active on 144 and 432 EME for many years and am now planning to try 50 MHz EME as well. My system will have a kilowatt amplifier, an outboard GaAsFET preamplifier and a couple of relatively slow coax relays inserted in the feedline between the 897D and the antenna more or less all the time. Coax relays are typically slow, taking 25-30 milliseconds to stop bouncing. Question: Is there a programmable TX inhibit time option in any of the 897D menus, such that one can make sure there is no RF coming out before the relays have stabilised ? If not, how long is the typical delay between the amplifier control line going active and the transmitter starting to output RF ?

Thanks in advance for any info

Adapters at UHF frequencies can have SIGNIFICANT losses or effect on the SWR. I understand the desire to use N connectors on antenna feeds, etc on VHF/UHF. I have multiple radios feeding one VHF/UHF antenna and thus use an AlphaDelta-4 antenna switch (5 SO-239 UHF connectors). I replaced the switch "common" connector with an N connector. The switch is a lot cheaper than the radio if I make a mistake, and easier to modify as well.

Personally, I think modifying an expensive radio is not a good idea. You really, really lower the resale value, plus you may always change your mind later about what you want.

From personal experience, I'm VERY hesitant to buy a modified radio; I have heard a lot of horror stories, and seen a couple myself as well.

I have to agree as well. The argument about N vs SO-239 connectors is valid, but a bit overplayed IMHO. Not to mention, if the connector "mod" results in a bad connection to the chassis, you have achieved nothing, if not induced more loss.

I too avoid modified radios, and in fact have dumped rigs I discovered were modified. One cannot help but wonder why is this person selling the radio if it has "all these great mods".

But back to the point, as Dean suggests, if you are really hung up on the N connectors thing, then a short, well made cable between your radio and say a switch or amplifier is better and safer than messing with the radio.

To each his own, but IMHO the standard connectors are fine for 99.999% of the people who own the radio.

Actually I can't answer the time question ; however I do run a linear
and have no problems with time delay on HF . The amplifier is 2KW
Raytrack DX 2000L ,
made back in 1969 , I activate the relay in the amp with a reedy relay
hooked to the FT-897D.
Works great no issues.

I think the concentric shafts on this control are plastic or Nylon which can allow some degree of bending. I seem to remember, but I could be wrong, someplace that there was a replacement that was made of brass that had been used by some who had the misfortune of breaking this control. I just can't put my finger on the source at this time so I may have dreamed it.

Just found a partial answer to this in the 897D manual:
{
MENU MODE No□028 [CW QSK]
Function: Selects the time delay between when the PTT is
keyed and the carrier is transmitted during QSK operation
when using the internal keyer.
Available Values: 10/15/20/25/30 ms
Default: 10 ms
Note: If you select "25 (or 30) ms," please do not attempt
to set Menu [No-030 CW SPEED] to a speed faster than
"50 (42) wpm," as the delay will make it impossible to transmit.
}

Follow-on questions: 1)Does the above apply ONLY when running CW
using the internal keyer? What happens if an external key(er)is
connected instead ?, 2)Does the above also imply that the amplifier
control line goes active simultaneously with the internal PTT ?

Actually I do not have an answer for the follow up.
I operate SSB with vox or PTT on HF with the amp.
In vox the relay in the amp cliks away with out issues.
Have not tried it on CW or other modes yet.

From: Patricia (Elaine) Gibbons
Topic: 16824 Message: 16826

I can say that my FT-897D with the AT-897, the RF power level is whatever I had previously set via menu #75..

I don't know if it matters much, however I usually spin the power down to 5 watts prior to pushing the tune button on the AT-897 .. Personally, I don't like the idea of full RF power passing through chattering relay contacts ...

Hi Germund,

How about making a home-brew circuit that give a negativ voltage on the input of the ALC of your FT897 for about 100 mS, starting when you push the TX.
In this case there is in this time 100 mS no (or very litle) HF output coming out of the FT897.
Is this a good idee?

Subject: [FT897] FT897D amplifier control - is there a programmable TX delay time?

Hello,

Contemplating the purchase of a 897D as a 50+ MHz-capable complement to
my FT1000D, but need some rather specific info before I can decide if
it is the right rig for my needs:

I have been active on 144 and 432 EME for many years and am now
planning to try 50 MHz EME as well. My system will have a kilowatt
amplifier, an outboard GaAsFET preamplifier and a couple of relatively
slow coax relays inserted in the feedline between the 897D and the
antenna more or less all the time. Coax relays are typically slow,
taking 25-30 milliseconds to stop bouncing. Question: Is there a
programmable TX inhibit time option in any of the 897D menus, such that
one can make sure there is no RF coming out before the relays have
stabilised ? If not, how long is the typical delay between the
amplifier control line going active and the transmitter starting to
output RF ?

Thanks in advance for any info

16828. RE: [FT897] Re: DSP and the 897

Yahoo group: FT897 (2007)
Date: 2007-01-11 23:59:40 UTC
From: Mark Vaughan
Topic: 16803 Message: 16828

I use a DSSC48 made by Alan or Midland. It is a cheap additional DSP filter like the expensive ADSP ones but you can normally find them at around £40 to £50.

It does need a few minor mods for automotive use, because you need the radio volume quite hi, this overloads the DSP input a little, and also the FT 857 and 897□s tend to distort at hi volume (Thd is quite bad on these radio□s). Inside the DSP box is an 8 ohm dummy input to a transformer isolator. We cut out the 8 ohm resistor so the radio see□s much higher resistance, distortion thd is much much better. Then we alter the output gain on the DSP output opamp to get a bit more volume.

Jochen DG2IAQ has documented the mod, it□s his mod and it works very well.

Now I can drive down the road working SSB without the XYL moaning about the hash, there is no hash.

I am well impressed.

Without changing the rig display, it automatically switches the mode to AM
and drops Tx power to 5 Watt....well that is what it does with the LDG
AT-897, guess it should work the same with your AT.

Hi All!

I have an FC-30 autotuner with control cable for sale.

Works with Yaesu FT-817, FT-857, FT-897, FT-100 and any other Yaesu products with the control interface.

$100 + shipping takes it.

I good in QRZ and can take a postal money order or check.

Trades considered.

I have owned and used all three of the T/W Filters DSP-9, DSP-59 and now the DSP-599. I have tried a number of others but none of them measure up to the DSP-599. If you are looking for an SSB ONLY filter don't buy a T/W as it is an all mode filter that also works of CW, AM and FM. You have an All Mode Rig why not and All Mode Filter.

73

Don

K9SFN / DJ0KM

P.S. Who wrote or what revied said it didn't work well on SSB???

That is correct - I got a brand new one in early December and it has an N-connector for its V/UHF side. I have just had a quick visual inspection and the physical dimensions of the N look identical to the SO-239 beside it for the HF, so Yaesu should be able to swap it easily for you, or if they won't, then if you can get hold of the same one you should be able to make the swap yourself - taking a soldering iron to your radio will of course invalidate the guarantee.

I guess we are both right, it just depends on how you choose use it.....

quote "Control from the front panel is simple and straight forward; just press Tune while transmitting, and the Z-11Pro will begin a tuning cycle. The Z-11Pro will even tune while you talk on AM or SSB. Although not required, optional interfaces are available for most Icom and Yaesu transceivers. With the interface, a single button-press transmits a carrier, executes a tuning cycle and returns the radio to its original power and mode." end quote

That is correct.

It would be very simple to change the type from SO239 to N, IF you can procure an N connector with the same flange size as the original. I am sure Yaesu would be able to supply it but at what cost???
To change it requires just 2 screws and a solder joint to the PA board.

16842. FT-897D is gone -

Yahoo group: FT897 (2007)
Date: 2007-01-12 18:47:33 UTC
From: john_stlmo
Topic: 16842 Message: 16842

For those who have been inquiring about my FT-897D - it has been sold and picked up.

I'll be canceling this group now also, but thanks to everyone for the great support the radio has here and keep up the good work...

I do understand your concern. However even if the change to a N connector gained you 1 db will you notice it? If you get into sat work you will most likely want to use an external preamp for receive on UHF. Most stock UHF radios aren't really great on receive sensitivity because they are designed to work even in a high RF environment. A preamp at the antenna will set your noise figure and eliminate the loss in the coax which will probably be greater than the possible 1 db loss in the UHF connector.

Topic: 16824 Message: 16844

It depends what you and/or the manual means by "interface" (I'm at work and don't have the manual handy):

If you mean the optional interface that includes the little pod, there is circuitry in there that does what you describe. That works, although I have technical reasons for not liking that architecture.

If you use the simple interface cable that LDG sells for the FT-897 (or which you can make), which is a direct cable between the Z11Pro and the FT-897 (two 1/8" stereo plugs, with "tip" in one end wired to "ring" in the other end, and a common ground sleeve connection), then there is no power reduction. This is what I use.

Of course, as you point out, you don't even need a cable at all if you configure the tuner to "auto tune" on any RF output.

So, there are three ways to go, and they all work.

> I guess we are both right, it just depends on how you choose use it.....
>
> quote "Control from the front panel is simple and straight forward; just press Tune while transmitting, and the Z-11Pro will begin a tuning cycle. The Z-11Pro will even tune while you talk on AM or SSB. Although not required, optional interfaces are available for most Icom and Yaesu transceivers. With the interface, a single button-press transmits a carrier, executes a tuning cycle and returns the radio to its original power and mode." end quote

Laika,

I believe the European verions for the Ft-897 come standard with an N connector for the VHF-UHF port. Why don't you contact Yeasu and see if they stock any of these N connectors?

16846. CW Beacon and Q. about One Touch Tune func. on my AT897

Yahoo group: FT897 (2007)
Date: 2007-01-13 08:20:08 UTC
From: Bo Holbo Rasmussen
Topic: 16824 Message: 16846

Hi all.

I have 3 questions..

1. I recently tried the CW Beacon (keyer) No matter how I set the menu items regarding this feature. I have the problem of the radio not switching back to RX after the keyer has done it´s business. There´s a delay of approx. 8 seconds until it goes into RX. This applies to all of the three PLY´s.
Does anyone have any suggestions as to how I can solve this?

2. I have tried to use the Ott. cable between the radio and the tuner without ever having it working.
Can anyone tell me exactly how to make it work!?

3. I have been looking for a good allmode TNC for my radios.
Have any of you tried several models? I will primarily be working PSK RTTY and AMTOR (and others of course)

16852. Broken MEM/VFO CH Shaft

Yahoo group: FT897 (2007)
Date: 2007-01-12 13:03:26 UTC
From: Ken
Topic: 16852 Message: 16852

Somewhat related to the tread regarding the loose control, but I actually managed to shear off the knob.

This is somewhat related to the thread regarding the loose control, but I actually managed to shear off the knob VFO/MEM knob.

In a freak accident, my cell phone fell and hit the knob in just the right place to break it off. I managed to pull out the remaining portion of the plastic shaft but, as everyone is aware, this control is multifunction. I attempted to repair the shaft itself with no luck, and then constructed a replacement out of a tapering wooden shaft, but that also proved unsatisfactory.

I ordered what I thought was the replacement unit (based on the Tech Manual) from Yaesu. Clearly the "VR Unit" in the exploded parts diagram in the manual is NOT the same... at least the one I received isn't. The shaft on the received part isn't close to the diameter to hold the knob.

I am wondering if anyone knows of a solution, short of sending the whole unit back? The shaft on the control seems to be pressure fitted and not actually attached to the encoder, but I could be wrong. In the other thread, Larry /WA0GWA mentioned he thought there may have been a brass shaft replacement and I am curious if anyone may know if that's the case and a source?

Thanks

Ken WA4SQM

16853. Re: [FT897] Price Increases - Wow!

Yahoo group: FT897 (2007)

From: Brandon Cruz
Topic: 16805 Message: 16853

Ummm... the 897D has been selling for over $800 until Yaesu recently offered the special allowing the rigs to sell for $770 or so. Perhaps you're confusing the price of the 897D with the 857D which sells for about $100 less. I've been watching the prices on both models for the past year or two and both models are now selling for the lowest prices that I've seen in that time frame.

Joe Biniskiewicz <joebinis@...> wrote: I purchased my FT-897D at HRO in December for $790 ($870 less $80 in
discounts). The price is still the same. If you can get one for $770 new
today, you are getting it $20 cheaper than I paid last month.

I just did some checking of the various radio dealer websites and the
prices on the FT-897D have shot up. I am now seeing between $769 and
$799 with a current Yaesu coupon. Even more startling is the FT-897D
Service Manual which was $16.95 is now ranging from $25.95 to $29.95.
At the time I bought my radio they were not in stock at $16.95 so I did
not get one. Guess I'll be waiting for one to appear on eBay!

That□s why I bought my Ft857 over from the USA.

We are ripped off for everything over here, be it taxes, transport, and companies needing to make a lot more profit to survive due our greedy Gov□t

I buy lots and lots from the USA and South East Asia.

I remember a number of years ago I need a new Oscilloscope. It was £15500 in the UK, $5500 in the USA, All Tektronix UK could say was they would not cover warranty on USA goods, hell I could buy three for the price they wanted here.

The little extra effort is well worth it.

16857. RE: [FT897] Broken MEM/VFO CH Shaft

Yahoo group: FT897 (2007)
Date: 2007-01-13 17:24:24 UTC
From: Mark Vaughan
Topic: 16852 Message: 16857

The shaft is designed to be sacrificial if bumped so that the encoder survives.

There are quite common threads on here where people have needed replacements, rather than using Yaseu part numbers, they have just sent a description of what they need and got the correct part, many buy a few spares. A brass one is a nice idea, but a busted plastic one is easier to replace, than the encoder.

Remember that before taxes etc., it is probably less that $1000,
and then Messrs rip-off and co have have to have their share.
There is very little competition in such equipment in the UK, what
with sole importers and mnufacturers failing to honour warrantees.

What price can the FT897D be purchased in (say) Hong Kong.

SignaLink SL-1+ For Sale

The SL-1+ connects to your computer's sound card and to your radio's Mic, Data or Accy Port. It is designed to work with ALL computer sound cards, and with ALL radios. The SignaLink SL-1+ is compact, low powered and fully isolated for optimum performance. It supports ALL sound card Digital and Voice modes, and does NOT use a serial or USB port!

I have been using this unit for PSK-31 on both my FT-897D and my FT-857D. Very well engineered...works perfectly. Can be jumpered for most any other radio.

Full details and pricing at my website: http://aa5fr.com/signalink.htm

Hi everyone on the list,

I am not able to connect Ham Radio Deluxe anymore to my 897D.
It was working a few days ago and now it wont connect.

I am using a serial-usb adapter from Belkin with the properly installed
driver.The adapter is on COM 4 (checked on system hardware) The radio
menus number 20 and 85 are setted correctly.

The CAT port on the 897D seems to behave normaly when connected to the
FC-30 autotuner.

Looks like my CT-62 cable are dead but i am open to any useful advice...

Many thanks in advance to all,

Dave VA2DV

Hi Dave,

I have the Belkin serial/usb adapter, too.

You might check that you are still plugged into the same USB port on your computer. If you plug your Belkin into another one, you might find that you are now on a different COM port for use with HRD.

Check CP / System / Hardware again and see if things might have changed.

16871. Re: CAT problem...I need help !

Yahoo group: FT897 (2007)
Date: 2007-01-15 12:48:12 UTC
From: Bill Barron
Topic: 16864 Message: 16871

Dear Dave~~

Set-up FT 897:
1) Make sure Menu 85 is 'OFF"
2) Menu 20 to 'CAT'
3) Menu 19 to 9600bps. More than 9600 creates
annoying cycle hum on 897.

On PC~~
1) Re-start PC.
2) Use 'My Computer' to make sure USB is in COM #4 and
that it is set to 9600 baud (default), Data bits=8,
Parity=none, stop bits=1, flow control=none.

By the way, USB serial adapters generally COM#5 and higher--
COMs 1-4 reserved for traditional serial ports. If you still
see 'COM#4', suggest you try a different USB port on PC.

Ham Radio deluxe:
1) In the HRD "sign in" window, where you
select the radio, make sure you've used 9600 baud, COM 4
and that the RTS box only [repeat ONLY] is checked.
2) NEVER check the 'automatically' connect option.

73,
Bill W1WAB

16872. RE: CAT problem...I need help

Yahoo group: FT897 (2007)
Date: 2007-01-15 15:08:37 UTC
From: Bill Erney
Topic: 16872 Message: 16872

Hi Dave
I had the same problem - I had a USB to Serial cable fail.
One day it was working with no problems - the next day it failed.
Fortunately I was Ham Radio Deluxe with two radios and two cables.
I switched my two cables, and confirmed that the first cable was
dead.
I bought my cable at Radio Shack - I replaced the cable and
an currently have three rigs running ham radio deluxe with similar
cables for about two years without any additional problems -
I believe that the Radio Shack part number for the USB to Serial
cable is 26-183. After that initial failure, there have been
no more problems. Good Luck

Just guessing here but....

On my PC one of the USB ports is a "master" and the others are seen by the PC as ports on a hub. Could it be that you found your "master"?

I know that some things do not like being connected to hubs and must be connected to the main USB socket.

As I said, I'm just guessing, but you never know :)

16875. PMS-Mode don't work with repeaters

Yahoo group: FT897 (2007)
Date: 2007-01-14 21:00:57 UTC
From: ars999tem
Topic: 16875 Message: 16875

Hello Group,

I have discovered a strange behaviour of my FT-897D (S/N 4Jxxx) in the PMS-Mode. When I put repeater channels in the PMS-Memory and activate the repeater-shift - manual or ARS, there is no different - and of course the PMS-Mode each time I push the PTT the display shows "TX ERROR". When I change the repeater-shift to 0.00 MHz, everything is ok. The same of course if I disable the repeater-shift and work simplex frequences. It has nothing to do with the jumper-settings. And I tested this with a further FT-897D and a FT-857nonD with same results. Has anyone an explanation for this or better, a solution for me? It would be very great!

SignaLink SL-1+ For Sale

The SL-1+ connects to your computer's sound card and to your radio's Mic, Data or Accy Port. It is designed to work with ALL computer sound cards, and with ALL radios. The SignaLink SL-1+ is compact, low powered and fully isolated for optimum performance. It supports ALL sound card Digital and Voice modes, and does NOT use a serial or USB port!

I have been using this unit for PSK-31 on both my FT-897D and my FT-857D. Very well engineered.. .works perfectly. Can be jumpered for most any other radio.

Full details and pricing at my website: http://aa5fr. com/signalink. htm

I just recently discovered that menu 82 applies to the currently selected VFO (A/B) ONLY! If you are using VFO A when you change menu 82, it applies to VFO A and does not apply to VFO B. The converse is also true.

16881. Re: Ft-897D VS Icom IC-7000

Yahoo group: FT897 (2007)
Date: 2007-01-14 23:47:18 UTC
From: Chuck
Topic: 16838 Message: 16881

One difference would be the dual DSP in the 7000, another would be the display reads multiple things at once like ALC,SWR,Compressor and power output. There is no need to change the display to see everything at once. There is also a nice band scope that is adjustable for type and range. Both rigs have a high stability TXCO.

I would preffer something large for a base though and if I was going Yaesu(new), it would be a FT-2000. If I were going for something new in the same price range in a Icom, it would be a proIII.

I do think the Kenwood TS-2000 is the best deal all around for a "ham shack in a box" that covers all bands and has the tnc built in.

Getting back on point, I would highly recommend giving the IC-7000 a test drive before you "pull the trigger" on the FT-897 purchase.

Best tuner I do not know. There are so many tuners to pick from these days. The ones I have tried I will comment on. I have the FC-30 AutoTuner that Yaesu sells for the 897D. It does work for as a narrow band tuner. I have the LDG AT200 Pro-Autotuner and that works well with it. I like it because I can just have one single tuner on the desk for all radios. This tuner tunes in more than the FC-30 does. Finally I have the LDG AT-897 for EmComm Field Station. That tuner also does a wonderful job for me. It tunes a great range.

Just my feedback. Best Regards,

Just remember that any tuner in the station does NOT
eliminate the line loss caused by using a non-resonate
antenna resulting in a high SWR.

It only tunes the antenna system so that your
897 always see a 50 ohm impedance load...if it can.

Again, what kind of antenna system (including feed line)
are you using?

If you are trying to load up on 160M using a 30 foot
wire, than NONE of the tuners Doc recommended will work.

In that case, Roberto, I suggest you look at the RigExpert.

It uses an extrenal sound card which significantly reduces
(15 dB?) the noise level of signals you can demodulate.

16893. AC power supply options

Yahoo group: FT897 (2007)
Date: 2007-01-16 06:09:49 UTC
From: John Rabold
Topic: 16893 Message: 16893

Does anyone have any disadvantages to report for the use of the Yaesu FP-30 AC power supply attached to the bottom of the FT-897? My understanding has been that stacking a transceiver and a switching power supply isn't a good idea because the power supply will induce a hum onto the transmitted signal. But maybe Yaesu has engineered that issue away.

The 897 manual lists other Yaesu AC power supplies as options, though they don't snap on to the 897. Does anyone here want to comment on the pros and cons of using other AC power supplies with the 897?

16894. An observation: 6m Band and LDG AT-897 tuner

Yahoo group: FT897 (2007)
Date: 2007-01-16 07:27:31 UTC
From: Johnny Burroughs
Topic: 16894 Message: 16894

Hardware:

Yeasu FT-897D

LDG AT-897 Tuner

AV-640 Hy-Gain 8 band vertical antenna

Problem: 6m Band and LDG AT-897 tuner.

Scenario 1:

Rig tuned to a 6m frequency via LDG AT-897.

SWR 1.3:1.

No Rx audio.

Did not QSO during Tx.

Scenario 2:

AT-897 by-passed. (Quick depress of the Tuner button)

First time Tx after by-pass - SWR is 1.3:1, First time signal Tx good.

Rx Audio is good.

Second and thereafter Tx, SWR is HSWR and Rain on Tx signal, audio remained good.

Scanario 3:

AT-897 Removed from circuit, Antenna connected directly to the rig

SWR is 1.5:1 (yes I do need to adjust the antenna but forget that for the moment)

Rx Audio is good (as in Scenario 2)

Tx is also good.

My observation, as has been that of other group members, 6m and the LDG AT-897 tuner does not work. Since making this observation I have decided to only use the tuner on a long or random wire for portable operation. A correctly tuned base antenna will in future be connected directly to the rig. Perhaps not a bad thing.

I bought the FP-30 with my 897D. I used it that way for about a year with no complaints, then switched to an Astron PS w/battery backup. I noticed no differences in operation, and had no negative signal reports with either set up. It seems like I have read about some of the the early FP-30s having a problem with inducing hash on signals, but I had no problems.

I purchased the Yaesu AC supply at the time I bought by 897D and have
had no problems (3 yrs now). I love it, as it keeps a small footprint
on the desk, and I can just grab the side handle and I'm off to the EOC
or where ever.

Apparently the early FP-30's had a problem. There was a design change and it became the FP-30B which is what is currently sold. I purchased one in August and have not regretted it. I occassionally do so some portable work (not outdoors) and an external PS is one last thing I need to lug along. Everything fits nicely in a Pelican case. I have an Astron SS-25 that I originally used with the radio and, while it is tiny, I still had to pack it along.

I've used two of the 25 amp MFJ Mightylites to power my FT-857 over the 3 years I've had it. One should have done it, but I kept carelessly dragging it off my desk until it finally broke. I've been more careful with it's replacement(G). Had I not been so clumsy the first of the two power supplies would have been sufficient.

I have one of those original FP 30's and returned it and the set to
the Toronto Canada dealer for fix-up of the bad noise problem. After
SIX MONTHS it still hadn't been fixed and the stated reason being
"waiting for spares from Yaesu" so I took the set back. A friend got
the service bulletin from Yaesu for me and the major problem was
installing three .01 caps in the power supply across +ve to ground,
-ve to ground and +ve to -ve. I bought the 3 caps from a junk shop and
installed them myself and all was well. Yaesu wanted the rig as well
so as to install some ferrite beads on the internal power supply line
but I installed them on the external power line. It really didn't need
the ferrites anyway. The 3 .01 caps were the problem.

Hi Peter,

I'd guessed at approximation to actual power out, as
on 2m the range is 5 - 50 and on 70cms 5 - 20.

Fits with the specs of the radio's Tx.

You misunderstand the purpose/usage of PMS. DON'T PUT REPEATER FREQUENCIES in the BAND LIMIT MEMORIES. Those are BAND LIMIT MEMORIES, not repeater memories.

Thanks to all for the comments so far, and for any yet to come. In summary, the currently-sold FP-30 works fine, and other supplies of sufficient amperage work fine too, though they are not as convenient. (Though if I have to run out to an emcomm assignment where there is no AC, I'd rather not have to drag along my AC power supply or have to fiddle with detaching it from my rig. Unless I think AC may come along later. Hmm.)

So I guess it comes down to whether the extra convenience is worth, for example, the $60 difference between the FP-30 and the FP-1023.

One difference would be the dual DSP in the 7000, another would be the display reads multiple things at once like ALC,SWR,Compressor and power output. There is no need to change the display to see everything at once. There is also a nice band scope that is adjustable for type and range. Both rigs have a high stability TXCO.

I would preffer something large for a base though and if I was going Yaesu(new), it would be a FT-2000. If I were going for something new in the same price range in a Icom, it would be a proIII.

I do think the Kenwood TS-2000 is the best deal all around for a "ham shack in a box" that covers all bands and has the tnc built in.

Getting back on point, I would highly recommend giving the IC-7000 a test drive before you "pull the trigger" on the FT-897 purchase.

IF DSP is huge in favor of the 7000, but the RX low power consumption is a big plus for the 897D, especially for field use.

Well, the IF DSP on the IC-7000 is clearly superior. I live with a lot of noise as well (which all goes away when my house loses A/C power!), and it seems that the IC-7000 does slightly better in pulling a signal out of the noise.

16916. Non-functional 897D - please help

Yahoo group: FT897 (2007)
Date: 2007-01-17 03:08:11 UTC
From: Dave L
Topic: 16916 Message: 16916

Before I call Yaesu, can anyone help?

As far as I know, the radio has not suffered any electrical or physical trauma.

When I power on the radio the following occurs:

0.00 V is displayed ? this happens regardless of the power supply used
MTQMB PKT is displayed
0.00 is displayed as the frequency

It did this too me once and I left it unplugged from any power for about a week as I was too busy to mess with it. Sunday I plugged it back in and it worked fine. This morning it did it to me again, but in the afternoon it worked fine. Then this evening it came up goofy again.

When it initially comes up in this state it functions quite oddly. The controls don?t work as I expect they would. For example, the Band buttons have no affect.

I?ve tried a power on with the F and V/M keys depressed and there is no change in behavior.

16919. Using the Icom AH-4 Antenna Tuner with the 897

Yahoo group: FT897 (2007)
Date: 2007-01-17 18:02:42 UTC
From: AKBiocca@comcast.net
Topic: 16919 Message: 16919

I just wanted to report on my initial testing with the FT897, the Better RF Tune adapter, and the Icom AH-4 Remote Antenna Tuner.
People might not think of using an Icom tuner with a Yaesu radio, but the AH-4 is one of the best remote tuners available. If you want wide tuning range and trouble free operation it is worth considering. Compare the eHam reviews of the AH-4 tuner with other tuners.
I connected my portable FT897 station up, much to the wife's annoyance, on the master bed this weekend for a few hours. I tested into a dummy load, and into my nonresonant multiband inverted L.
Each time I pushed on the Tune button on the FT897, the AH-4 purred for a short time and found 1:1 SWR for that frequency. Subsequently pushing the Tune on that frequency took much less time and was basically a click rather than a tuning activity since the settings were stored in the AH-4 memory.
The AH-4 is very quiet (in the audio sense) compared to other tuners. It purrs as it tunes rather than the loud clatter that some tuners generate. That may be due to the water-resistant sealed case enclosing it. Since it is usually remote you don't normally get to hear it at all.
So far, the Icom AH-4 and the Better RF Yaesu Tune adapter worked perfectly. I will be taking it to Quartzsite next week and giving it more of a field workout, and will update the web page thereafter with any good or bad experiences.
I made a web page with more info describing the AH-4 and how to use it with the Yaesu radios, and my experience with several remote autotuners.
http://www.hsfdg.org/wiki/IcomAH4Tuner
To use the Icom tuner with the Yaesu radio requires an adapter. I used the one made by Better RF. It connects to the radio via the CAT cable and provides the standard 4 pin Icom tuner connection, so this is Plug and Play. The Yaesu is configured as though it had the FC-30 tuner installed in the FT897 menus. The Better RF adapter turns the radio power to about 10 watts during tuning, and the AH-4 uses an attenuating pad so the transmitter does not see high SWR during tuning, plus the emitted signal on the air is very low.
Note that without the AH-4 tuner the Better RF Tune adapter still turns the radio power to 10 watts when the Tune button is pushed, making it easy to safely tune other tuners or test your antenna at low power without having to fiddle with the radio power settings manually. This is especially useful with motorized antennas and all antenna tuners.

Topic: 16920 Message: 16920

Hello all,

I am currently finishing a new relese of Virtual Legacy Radio
(http://ok1fig.nagano.cz/vlr_overview.htm).
I completely re-wrote the serial communication, it is much more
reliable now.
Another part of the package will be the DX-Cluster client that will
insert spots to
the scale of VLR as frequency markers. It will be released in a few
days.

I wonder whether anyone invested effort to defining new bands (e.g. for
the u.s. band plan, air-band, etc) or
created new freqency markers (beacons mainly). If you are willing to
share your work with others please send me your
Bands.tsv and FqMarkers.tsv files (from c:\Program
Files\BrineSoft\VirtualLegacyRadio1\).
I will update the installer with it.

Yaesu FT 1000MP Mark V Field for Sale

Purchased April 2006 was one of the very last ones available from AES (S/N 5IXXXXX). Rig has has little use. Mostly used on CW with an input of 50 watts.
It has the MARS mod done. It Includes the Inrad Roofing Filter and Inrad 715C
and 716B 2.8 SSB filters plus the Inrad narrow CW filter. It operates perfectly. This radio is like brand new and has been covered while not in use (cover from Radio Covers - Black felt with Gold lettering - included). $1425.00 plus shipping from 77356.
Thanks!!

I just use 12V deep cycle batteries for my power. They work when the power is off (unlike an AC power source), they are portable, and they do not induce noise. Batteries are also an economical choice when compared to purchasing an AC power supply.

My two cents.

From: ars999tem
Topic: 16875 Message: 16933

Hi Dan!
Thanks for your answer. But I don't understand, why I should not put repeater frequencies in the band limit memory. Why I would like to do so? When I'm in an area by car where I don't know the reachable repeaters on the 430MHz-Band, I would like to store the most low and most up repeater channel in this part of memory. Than I start the PMS-Mode and scan the whole repeater channels and talk to somebody who I hear. It's is much more comfortable for me, than put all the repeater frequencies in the memory. So I'm wondering, why it's not possible to work with shift in the limit memory area.

Date: 2007-01-17 02:05:32 UTC
From: aa1tc
Topic: 16935 Message: 16935

On the FT-897D there is a meter for SWR, ALC and PWR. Is there a way to see what the actual signal coming in is. As far as signal strength is. Is there any well kept secrets?

Tim

16936. Accu for FT-897

Yahoo group: FT897 (2007)
Date: 2007-01-17 20:46:47 UTC
From: Frank Ulbrich
Topic: 16936 Message: 16936

Hello,
I own a FT-897D and would like to know if there are some third party products which may substitute the accupaks (FNB78) and/or the charger (CD-24).

I think these additional devices are to expensive.

Maybe someone has experinces in making a homebrew charger.... I am a little bit afraid to build a selfmade accupak ... I would like to prefer a comercial product for this.

From: Gary
Topic: 16879 Message: 16938

Jim,

My PnP works just fine on my 897. I've gotten it to work with both Ham Radio Deluxe and HamScope. It receives famously just using MMTTY, but can't actually control or send without something else between. To actually control the radio, you will need the "other" cable from the PnP to go into your CAT port on the radio. The two connectors are different, so you can't get them reversed.

Make sure that you followed the setup directions for the PnP. Sorry, that is like saying "make sure the power cord is plugged in", but I said it anyway. Don't take offense.

I'm enjoying my PnP very much. Keep us updated on your progress or lack.

73,

Gary

16940. FT897 Default Bands

Yahoo group: FT897 (2007)
Date: 2007-01-17 21:06:28 UTC
From: kd2mx_nj
Topic: 16940 Message: 16940

Normally my FT897 has 15 bands to switch between using the band switch. These are:
160,80,60,40,30,20,17,15,12,10,6 & 2meters plus fm broadcast, 108mhz & 432mhz.

Sometimes when I tune above or below the limits of one of these default bands, a "new" default band entry will be created. Sometimes it will "go away" by tuning back into the limits of the nearby standard default band, but in other instances I have a difficult time removing this new "default". Creating another new one seems to make the old "new" one go away

I haven't been able to find this behavior documented although I assume it is intended "feature". I find the feature's behavior is a bit unpredictable.

Does anybody have an explanation/pointer?

Thanks
Paul/kd2mx

The one other thing to keep in mind depending upon your plans for the radio is that if you do use the internal PS you loose the area designed for the internal batteries. Not a problem if your not going to use them, but if you had plans to power it portably off them you have a problem.

16942. Re: Using the Icom AH-4 Antenna Tuner with the 897

Yahoo group: FT897 (2007)
Date: 2007-01-18 15:02:40 UTC
From: Gary
Topic: 16919 Message: 16942

Alan,

I too use an AH-4 with my 897, but since my data ports on the back are busy with rig control, etc., I use a tuning head for an old AH-2 tuner. I do have to manually set my power down to 10 watts before I click the "tune" function on my rig control program and then press the tune button on the control head, but it all works great. I can do the mouse clicks and be tuned in less than 10 seconds.

I use my AH-4 with a full wave loop on 80. I just attach one leg to the top post, one to the ground post, leave the tuner ungrounded and it works like a champ.

Great tuner in my book.

>
> I just wanted to report on my initial testing with the FT897, the Better RF Tune adapter, and the Icom AH-4 Remote Antenna Tuner.
> People might not think of using an Icom tuner with a Yaesu radio, but the AH-4 is one of the best remote tuners available. If you want wide tuning range and trouble free operation it is worth considering. Compare the eHam reviews of the AH-4 tuner with other tuners.
> I connected my portable FT897 station up, much to the wife's annoyance, on the master bed this weekend for a few hours. I tested into a dummy load, and into my nonresonant multiband inverted L.
> Each time I pushed on the Tune button on the FT897, the AH-4 purred for a short time and found 1:1 SWR for that frequency. Subsequently pushing the Tune on that frequency took much less time and was basically a click rather than a tuning activity since the settings were stored in the AH-4 memory.
> The AH-4 is very quiet (in the audio sense) compared to other tuners. It purrs as it tunes rather than the loud clatter that some tuners generate. That may be due to the water-resistant sealed case enclosing it. Since it is usually remote you don't normally get to hear it at all.
> So far, the Icom AH-4 and the Better RF Yaesu Tune adapter worked perfectly. I will be taking it to Quartzsite next week and giving it more of a field workout, and will update the web page thereafter with any good or bad experiences.
> I made a web page with more info describing the AH-4 and how to use it with the Yaesu radios, and my experience with several remote autotuners.

> http://www.hsfdg.org/wiki/IcomAH4Tuner
> To use the Icom tuner with the Yaesu radio requires an adapter. I
used the one made by Better RF. It connects to the radio via the CAT
cable and provides the standard 4 pin Icom tuner connection, so this
is Plug and Play. The Yaesu is configured as though it had the FC-30
tuner installed in the FT897 menus. The Better RF adapter turns the
radio power to about 10 watts during tuning, and the AH-4 uses an
attenuating pad so the transmitter does not see high SWR during
tuning, plus the emitted signal on the air is very low.
> Note that without the AH-4 tuner the Better RF Tune adapter still
turns the radio power to 10 watts when the Tune button is pushed,
making it easy to safely tune other tuners or test your antenna at low
power without having to fiddle with the radio power settings manually.
This is especially useful with motorized antennas and all antenna tuners.

The advantage of the ATAS-120 is of course that you don't need a
separate tuner. Note that the ATAS-120 will not tune 80m or 160m.

You can operate the ATAS-120 portable on a tripod-type mount thusly:
http://www.ae7q.net/doc/public/ATAS-120.html

Not so much a well-kept secret as it's just not worth mentioning--in RX, the meter is always an S-meter.

Multi-function row "i" buttons A & B only affect what the meter shows during TX (button B simply rolls through SWR/ALC/PWR in the opposite direction of button A)...

Oh OK, I see what you want to do; you ARE treating the PMS registers as band limit registers (as you should). However, are you adding (for the high limit) or subtracting (for the low limit) the repeater offset for that band, so that when you key the radio, the transmitter is still within the limits? I don't know if that a requirement, but it's something to try.

Also, what happens when you set the PMS band limits to the edges of the entire repeater portion of the band (eg, 440.0 & 450.0 for UHF)? Does the radio work fine then? I'm at work now and can't try it, but I will when I get home.

OK, I tried setting the PMS band limits to 440.0/450.0, 440.0/445.0, and 443.725/443.725, pressed PMS, and then each time tried to transmit on a local repeater (443.725/448.725), and each time it worked fine. There was no need to take into account the repeater offset, as I mentioned in my previous message (below).

Are you sure you are putting the lower limit in the "L" portion of a pair, and the upper limit in the "U" portion?

Perhaps if you listed the contents of each of the band limit registers P1L/P1U, P2L/P2U, P3L/P3U, P4L/P4U, and P5L/P5U, we could help.

Tim,

The radio defaults to S meter on receive. But, as it takes its signal from the agc line, you will not get any indication if you turn agc off.

16952. Re: Tuner for FT897D

Yahoo group: FT897 (2007)
Date: 2007-01-19 10:29:03 UTC
From: dj5hd
Topic: 16883 Message: 16952

Hi Tim,

coax tuners like the FC-30 or AT-897 are acceptable if your antenna is nearly resonant and you just want to match it to 50 Ohms. You will have higher coax line losses as higher your mismatch is.
You may get good results when tuning a G5RV, that has already a low SWR of less than 3.
Tuning a random wire with a coax tuner or a so called "magnetic balun long wire" is a waste of money and electric power.

I have an ATAS-120 for HF mobile and it works well on 20m and up. This is an electric short antenna with all its compromises. Do not expect it to work like a full size antenna.

For expeditions and portable use I prefer the FC-40 antenna coupler. It has the advantage, that it matches the antenna at the feed point, so your SWR on the coax is 1 and you get a low-loss system.
You may use different radiators, monopoles, dipoles or loops.
I use a 12m tall fiberglass rod with a vertical wire and some 10 radials, each about 5 to 15m long. This is a portable, very effective DX-antenna.

This is the first I have heard of this. If I understand this correctly, you can have the FP-30 AC power supply attached, OR you can have one or two of the FP-78 batteries attached, but not both.

So my followup question is: How inconvenient is it to disconnect the FP-30 AC power supply and connect the batteries ... in the dark using a flashlight? Is it really a "problem"?

I didn't find it terribly difficult to install the power supply. But under the conditions you describe, it could be tricky as there are six small screws you have to keep track of. Also, the bottom plate of the FT-897(D) is removed and replaced with the power supply that includes its own wire bail stand. After installing the FP-30, the original bottom plate should be stred away for future use should you decide to remove the FP-30. In the case of doing a field swap, you would have to lug it along as well.

For emcomm interoperability I will probably get one or two of those and a good trickle/float charger even if I do buy one of the built-in NiMH batteries, but I had not really considered that sort of system alone; I don't think I want 12v batteries, cables, and fuses here in the house next to the radio. I've seen that approach diagrammed in ARRL's Emergency Power book, though. Using your 12v system with the 897, do you sacrifice maximum Tx power as you do when using the NiMH batteries (maximum 20W Tx)?

16956. Re: [FT897] Re: Tuner for FT897D

Yahoo group: FT897 (2007)
Date: 2007-01-19 15:45:59 UTC
From: Alan Biocca
Topic: 16883 Message: 16956

I have used the FT897 with the LDG AT897, Icom AH-4 and SGC 239.

I looked at the Yaesu FC30 and FC40 but found them wanting. Check the eHam reviews for more information. Both of these tuners have limited matching capability. The FC-30 has a fan that runs all the time. The FC-40 looks better but has trouble matching one wire on all bands, according to reviews.

I would not put the LDG AT 897 in the same class as the FC-30. The LDG is significantly more capable, uses latching relays, and has no cooling fan. The FC-30 wins in the beauty department, but the LDG is significantly more functional.

I have used the AT897 with a 1:1 balun right on the connector to balanced feedline to a 100 foot dipole and it matched well on bands 80 and up. The LDG is a fairly wide range tuner, but not as wide as the Icom AH-4.

The Icom AH-4 requires an adapter to work with the Yaesu FT897, but it works extremely well. It will match as little as an 8 foot whip on 40 and up, or a 23 foot wire on 80 and up. It works on 160 with somewhat less matching range (despite that Icom does not rate it for 160, it does the best it can with less L and C so it becomes a limited range tuner on 160). I use the Better RF Tune adapter.

While the FC-40 users seem to have trouble finding any one wire that will work on all bands, with the AH-4 I have had good success with every wire I have tried. I do try to avoid half wave multiples which present a very high impedance and give tuners problems.

The AH-4 is also lower in cost than the FC-40, even when including the cost of the adapter.

I have had problems with the SGC 239. It works some of the time, but occasionally it goes crazy for a couple of minutes and throws the tune out, so you disappear while transmitting. I have had this happen in many locations with many different antenna configurations. It matches perfectly, then while transmitting it randomly goes nuts. It is quite frustrating. I suspect the CPU in the tuner is suffering from inadequate shielding causing it to reboot. It stops this behavior if I keep the power down to 20 watts or so.

I have collected more info on the AH-4 on a web page:

http://www.hsfdg.org/wiki/IcomAH4Tuner

I am testing a new manual tuner now, the Palstar AT1KM. This tuner is a bit larger than the FT897, but is rated for 1200W. I had a small problem with the inductor counter, but otherwise this is an excellent tuner for the home station especially if an amplifier is planned later.

Good luck with your new radio,

From: wayne
Topic: 16957 Message: 16957

Hiya guys,
Has anyone got any information for constructing a cable for
CAT, i want to use Ham radio deluxe software to control the rig, the
price of a CT cable is in my opinion very high, if anyone does have
info to build this from scratch then i would love to get it

Thanx guys

From: Ken Bandy
Topic: 16893 Message: 16958

You are correct. It's an "either/or", not both. As I recall, the FP-30 attaches with 4 or 6 screws, what ever holds on the bottom plate, that is replaced by the FP-30.

To answer your followup, it isn't any big deal to disconnect the FP-30, as it is just a matter of disconnecting the DC power inlet on the back, but in order to install the FP-78 batteries, get out the screwdriver.

73,
Ken

This is the first I have heard of this. If I understand this correctly, you can have the FP-30 AC power supply attached, OR you can have one or two of the FP-78 batteries attached, but not both.

So my followup question is: How inconvenient is it to disconnect the FP-30 AC power supply and connect the batteries ... in the dark using a flashlight? Is it really a "problem"?

I went for the AT-897 and have not been disappointed. I like how it attaches to the side of the rig. I've used it with a 300' longwire and an even longer loop. I've been quite successful on 160m-10m. The AT897 usually gets me an swr of better than 2:1. There is no feedline to speak of, just a short piece of coax over to the window. I'm even able to sometimes tune the wire up on 6m, although it doesn't work too well there.

The hardest part is finding the small black screws in a black case on the outside. Then dropping the screws and trying to find them <g>. The actual procedure is simple. Just a couple of minutes for everything assuming you don't lose any screws. Even then you don't need all of them to hold the cover in place.

Alan:
I also have the AH-4, FC-40, and SGC 239. I wouldn't listen too much to the reports of the FC-40 not being able to tune a wire to all bands. None of these tuners can feed a voltage node. I think it's likely the person doing the eHam review ended up with a 1/2 wave wire length on some band and couldn't tune it. I've been using an FC-40 on my 897 and have not seen it fail to tune anything that I would expect it to tune. It also seems to be a very robust tuner and functions well with the 897.
I use the AH-4 on my IC-7000 in the car and it also is a very good tuner. It's yet to fail me other than not always giving me the best tuning solution. In all fairness, I've seen this with just about every relay based tuner I've used, including the SGC and several LDG's. The solution is to get it to tune to one side or the other and you can generally get it to give you a better match at your intended frequency. Having the SWR graph on the IC-7000 makes doing this a breeze.
In short, I'd highly recommend either the FC-40, AH-4, or any similar tuner.

Dan, first of all, thanks for your efforts to help me. What I have done: In Germany - and I think in the whole region 1 - UHF-repeaters are between 438.650 and 439.425 downlink and have an offset of -7.6 MHz (431.050 - 431.825 uplink). I put 438.650 to P1L and 439.425 to P1U and activate minus-offset with 7.6 shift. There is no differnet - as I mentioned in my initial request - to use manual or ARS repeater shift control. And this don't work! If I deactivate the repeater shift control or set the offset to 0.0 MHz, I could transmit on the downlink-QRG. That's it.

From: mrmsudawgs
Topic: 16883 Message: 16963

Tim,

Save yourself some time and effort and purchase a MFJ-969 tuner. I have already done the research concerning my FT-897D, tuners, and multi-band antennas. I too found that the FC-30 auto tuner will not tune full multi-band antennas as the FC-30 is looking for something rather close to resonant (cut to the right length to begin with). I'm using a large horizontal loop about 600 feet long so right away the FC-30 was a no go. The MFJ-969 will tune random wires, balanced lines, long wires, etc...and has connections for all types of antennas. Look into it. You will be glad that you did.

Don,

Like you I have tried all three TimeWave's, plus
several others.

I am currently testing the Vectronics 884, and
when returned from MFJ Service, will test the 784B.

I am observing some processing artifacts with the
884 that I don't like but it may also be me just
learning to tweak the settings.

I recall that the TimeWave 599 had some artifacts
as well, though it has been long enough that I am
unable to quantify the comparison.

I suppose it is unreasonable to expect zero artifacts
from a "processor".

WDYT?

Depends which Timewave DSP you are considering
and what "receive capability" you are attempting
to accomplish.

The Timewave 599 is good at about everything,
and the price shows it!

The MFJ/Vectronics 884 is also excellent, and
a bit less costly.

16967. SAVE some $$$ on new LDG tuners - slightly blemished case

Yahoo group: FT897 (2007)
Date: 2007-01-19 16:22:24 UTC
From: w4wb
Topic: 16967 Message: 16967

Hi Folks,

We have some new LDG autotuners that are factory fresh, but have very slight cosmetic blemishes on the case. Electrically they are fine. They are being discounted because of this. The two-year warranty on the electronics is still valid; however, they are being sold AS IS. Also, please don't ask me to tell you what the blemish might be or to pick out a "good one" for you ... I will not do it. :-)

To see what is available, go to www.w4rt.com and then click on "WHAT'S NEW" or go to the LDG Section, select AUTOTUNERS and then the specific autotuner. If there is a blemished unit available, it will be shown.

Please be aware that the quantities are very limited and available of such items will be changing over time. Also, if you order a blemished unit and it is sold out already, there is no rain check or otherwise. The order will be cancelled and you will be notified. Our web site is updated manually fairly often, but not in real time.

Thanks and 73,
Barry W4WB

The 897 runs full power on 13.8 brought in from the rear power connector, regardless of the actual source. It restricts to 20W when powered only from the internal connectors for the NiMH batteries.

Another alternative is to put both a rechargeable and a power supply into the 897 cavity, this is possible. More info at:

Hi John. If you're simply interested in stand-by power in a fixed installation, you could do what I did, and get an Astron BB series PS and an AGM type battery. This is the unit that will float charge a battery, and switch to it automatically in the event of mains interuption. Kind of like a DC UPS. If you already have a PS, West Mountain makes the "PowerGate" series of controllers. It will take a power supply and a battery, and do the same thing as the Astron unit.

If you go the Astron BB route, be prepared to wait. I think I waited over 2 months for mine, as they are "special order" items.

I would say that swapping them under any conditions but a nice lighted work table is not feasable - as several people have mentioned the screws are not designed for that. If you plan on using the internal PS and internal batteries your only real option is to not perminetly mount one of them, or I have heard someone who made a case expaneder to lower down the power supply mount points and retain the battery cavity.

You can easily mount the battery inside and simply use the internal power supply without mounting it to the radio. That would be the simpler arrangement as the PS electrically connects to the radio thru an external (back of the radio & PS) plug. Whereas the internal battery uses a set of connectors inside the battery case, meaning your would have to move that connector outside to connect both if mounting the PS.

Alternately if you get a Deep Cycle 12V Battery that can supply at least the same AH rating of the internal (4500) you can easily connect it to the same power input plug as the PS and run it like a mobile (swaping the battery plug or PS plug as conditions demand). Couple of advantage in this being the external Battry probably would have a lot higher AH rating and last longer, and be able to continue to operate at the higher power limits. Course the downside would be more weight in the combined setup.

Does anyone have a recommendation for a good gel cell battery? I'd like one for the shack, to be connected to the West Mountain Powergate, and also to take along for portable operation with the FT-897. The brand, model and source would be appreciated.

I'd go AGM rather than Gel unless the Gel is really cheap (would be used). New they cost about the same, but the AGM has many improvements over the Gel. both are VLRA sealed and very good for portable use.

To get specific, Concorde AGM from Northern Arizona Wind n Sun, pick your capacity. I like the PVX 490T for carrying around (not too far)(though I had to add handles), or the PVX-1080T for less portable needs. A pair of the PVX-2240T 6v in series is really the best setup.

Here's the web page:
http://store.solar-electric.com/cosuagmba.html

Or go to Sam's Club and get a pair of 6v Golf Carts for the best cost. (possibly WalMart as well). These liquid type batteries can spill but are lower in cost, so these are not quite what you were after.

For more portability the PVX-340T is very convenient.

For shorter operational periods the common 17AH Gel batteries can often be picked up in good condition from flea markets. They are pulled from equipment after a few years of standby use and are usually serviceable and about half the price of new batteries.

The larger 12V jump boxes usually contain these same 17AH batteries and have convenient handle, enclosure, charger, light, etc. Get one of those and add the leads for the rig. Anderson Powerpoles are recommended for this.

16980. Problem installing Inrad 712F 300Hz CW filter

Yahoo group: FT897 (2007)
Date: 2007-01-21 02:30:50 UTC
From: Gary
Topic: 16980 Message: 16980

Hi
I installed a Inrad 712F 300Hz filter this evening and can't get the thing to work. It shows up as FIL2 on the screen which is right as I installed it in that slot. The filter can only be installed one way so I didn't get it in backwards. There are 3 pins on one end and 4 on the other so it can go in just one way. When I press the FIL2 button to activate the filter the rig just goes silent. I can turn up the volume and get a hiss but can't tune in any signal at all. I am new to the FT897 and probably don't understand just what needs to be done to get this to work but the manual only has 8 steps. When I press the CFIL button I get my audio back and all works like before I installed the filter. Any ideas Please ?

Thank You
Gary

From: Mark Vaughan
Topic: 16957 Message: 16984

This may not work on all RS232 ports, though it will work on most. RS232 technically requires + and - 12V. Many modern ports aren't as fussy and will even work single ended with just a 5V TTL input, only needing the TX from the PC to radio to be limited. If I'm developing a circuit, I will often hang a wire from a 5V data stream onto a RS232 input to monitor the data on a PC.

For these radio's though, I'm not sure why so many people bother with transistors and a half solution. A max232 chip will do it all exactly to RS232 defined spec., it generates it's own + and - 12V rails, and is built as a highly noise immune RS232 to TTL line driver, you can even power it of the RTS line on the RS232 port. It's a simple circuit, one chip and a few caps. Note the capacitor value depends on the suffix in the end of the part number, some need 10uF tant caps, the newer ones use 100nF. The whole solution is nice and small. You can use a large RS232 connector shell, solder some strip board to the back of the 9pin din connector and get it all in the headshell.

There are loads of designs on the net, plenty on mods.dk, and there were some on this sites files section.

If you are in the Memory mode on the radio when you initiate scanning it will scan ALL the memory channels that you have not specifically excluded. to scan using PMS featues you need to make sure you are in the VFO mode before activating PMS and Scanning.

I have had the same problem with the scope not working, but if I toggle to memory, then back again it works. I don't actually have to put the frequency into memory, but I can see why Bill got that impression. Go figure! This is definitely a bug in the firmware

I also found I can use the VFO/Mem knob when the scope is running to change freqencies and start a new scan. That can be pretty handy.

Just as a general comment, it would have been nice had Yaesu not mounted a 1/4" phone plug for the receive audio directly under the three most heavily used push-buttons on the radio. If you use headphones, the jack protruding makes pressing the function buttons very difficult. I use the Heil mic/headset combo and having to plug the audio into the front panel there is a pain in the butt. An 1/8" jack would have been a partially acceptable compromise but of course that isn't "communications standard". I suppose I could build up an extension cable and plug the headset audio into the back of the radio... Any other ideas?

16991. Older rigs receive audio vs 897

Yahoo group: FT897 (2007)
Date: 2007-01-22 13:46:10 UTC
From: kc0nro
Topic: 16991 Message: 16991

All,
I have been an 897 owner for a few years now...absolutely a great rig!

I have recently been in the shack of some other hams in my area...they are all running older HF rigs (Kenwood 940, Yaesu 101, etc)...and I can't get over how much more quiet their receive is than mine on my 897...

I know there are about a million factors that would cause the receive to sound different (time of day, band, propagation, filters, antenna, etc), but it is not even comparable. I am running an 80m loop, so I should have a real quiet antenna...

I have messed around with the DSP...changed the settings for the bandpass filter, adjusted the level of noise reduction, cranked the RF gain, everything I could think of. Also adjusted the AGC...

Are there other settings on the 897 that should be explored to quiet my receive? I am using the stock speaker of the rig, and am considering buying a better speaker with a lower frequency response...

My meter on the rig (on 75m at night) almost always says S9 (for the background noise). I can adust things to bring the signals in...just want to know if there are additional things that can be done to improve the receive...

73 and many thanks in advance,

JOHN

Hello John,

When I purchased my FT-897 it seemed to be noisy to me, too.
I made a comparison. The same antenna, the same time, the same table.
FT-897 vs. IC-751A and very old and simple IC-730.
Honestly, even that I really like 897, I can't say that the listening
was better on it than on these two old Icoms. In most cases it was
about the same. It sounded differently, but the legitibility of weak
signals was about the same. However, in one particular case, I heard
very faint CW signal on 14 MHz on aged IC-730, and I was not able to
hear anything at all on 897.
Just my experience.

From: pa3bca
Topic: 16992 Message: 16995

I think that you'll find the 897 noisier than the older rigs. I compared mine with my TS130 and a FT101 and the 897 is definitely noisier. Well, the 897 is a compromise rig so I was not totally surprised..
What might help:
On 20 meters and below you should enable IPO.
IPO - Intercept Point optimisation - now there is a euphemism..
What it actually does is disable the pre-amp. And you most certainly dont need a pre-amp on 80 or 40, or even on 20 meters.
Enabling IPO (disabling the pre-amp) improves the SNR and prevents overloading your front-end on 80 en 40 during the dark hours. My 897 sounds less noisier with IPO enabled, even though on 80 it should not matter as the band noise is much higher than the rig's noise...

Funny observation: seeing the s-meter on S9 due to noise enhances your feeling that the rig is noisy.

regards,
minto pa3bca

For what its worth department...I had a similar dilemma when needing the CAT and DATA output connectors for control functions on my new 6 meter amplifier with my FT-897. I wound up buying a YAESU control cable for their HF linear amplifier (cheaper and in-stock than from YAESU) from AES Cleveland and cannibalizing it !! The other options are to buy a suitable cable from RT Systems (also not cheap) and modifying it , or buying individual 8 pin miniature DIN connectors and soldering them yourself...can be done, but Good Luck...you'll need a pair of Donnegan Magnifying Glasses, etc.
There is a possibility that The RF Connection may start making and selling these types of cable ass'ys. www.RFC <http://www.RFC&THERFC.com> &THERFC.com (800) 783-2666.

Good Luck with your miniature projects.

Turn your RF gain down to about 25 or 40% then turn your volume up. Your receiver will be much quieter. (The RF gain is controlled by the outer ring on the volume knob.) Pair that with the DSP and other audio tuning within the menus and you will see a very quiet receive.

From: dazcaz
Topic: 16991 Message: 16999

For 2 years I ran my 897 alongside my FT-900.
At the end of this period I sold my 897 and kept my 900.
The 900's receiver was crisper, the rig was easier to use, and all in all the 900 was a better HF rig. TX audio was better too.

I hated the way the 897 sounded. Even through cans it was horrid. In side by side tests between my 897, 900 and FT-817, the 897 came out bottom on nearly all tests.
The DSP made a difference occasionally, but I found that most of the time the 900 heard the sigs the the 897 couldn't unless the 897 had the DSP turned on.
The 817 and the 900 were neck and neck all the way (more or less), but the 897 fell down big time.

The 897 also lost out on CW, but the 900 has the CW filter fitted so perhaps an unfair test.

I don't miss the 897 at all. I'm rarely on V/UHF so I don't miss it.
I have the 817 and my VX-7 for local 2M FMing.

Thats the exact thing i do with my 897, it is a very noisy radio, even a signal of 6-8 will sound more like a 3-4 so i use both the rf gain and an audio EQ to alter the sound of what the radio is putting out, soon buying a 1000mp mkv with roofing filter, now that thing is quiet, will keep the ft897 for mobile work.

Thanks ya'll for the CAT wiring ideas.

Beside being noisy, I was very disappointed in my 897 when I received it because the front end was easily overwhelmed by strong signals as far as 15KHz away from the VFO frequency, especially on 40m/80m/160m. After doing some web searches and scanning the archives of this group, I decided to lower the RX gain settings in the service menu. Although I don't have the exact numbers in front of me now, I reduced HF1RXG and HF2RXG by about 15% and HF#RXG and 50MRXG by about 10%. What a difference! It's quieter, much less prone to overloading, and the AGC now works much more smoothly. I don't notice any reduction in being able to hear weak stations. In fact, I think some weak stations are easier to hear because of improved S/N ratio. The S-meter is probably a bit on the low side, though.

I also use the DSP DNR almost all the time with a setting of 9 or 10. It helps a lot. The DSP DNF is very poor and the DBF is not much better. And yes, learn to use the RF gain control instead of the AF gain.

If you make any changes to these settings, make sure you write down the original values and change them a little at a time.

Hi All,

What Minto says is absolutely right! If you follow many of the detailed reviews on receivers you will note that they usually are very careful to do most of their measurements with the preamp OFF! Preamps can be a blessing or a burden, and all too often it's the latter.

But the error I think most people make is to simply run their RF gain wide open all the time. That's a very bad habit to get into. Look how many rigs these days have the RF gain coupled with a squelch control--if you don't go to the menu and opt to have the RF gain control vs. the squelch, then your RF gain is running full blast all the time. More often than not, as pointed out by several others, running the RF gain at about 60% to 70%, or maybe even less, can be very beneficial. It's a technique everyone should work on, and the more you do it the better you will like it.

I'm not prepared to say the FT897 is a great receiver, but I find it is very adequate if I use the controls properly. I do have better receivers--the Orion II for example--but that rig is almost in a class by itself, and you can see that clearly from the specs. I won't be trying to make a comparison between those two rigs, because it's almost like apples and oranges. But when you do try to compare

receivers, you must do it under exactly the same conditions--same antenna, same location, etc. And with the preamp OFF!

Another control that is underutilized is the AGC control. While AGC is a wonderful thing, it is frequently better to have it completely off. If you hear strong adjacent signals for example, you might want to turn the AGC off, and jockey your RF gain control as well. A lot of that "pumping" just might go away. I found out that the AGC on the Orion II was adversely affecting QSK at higher speeds.

Fortunately, most newer rigs give you considerable control over how they perform via the menu settings. Unfortunately, most newer rigs give you considerable control over how they perform via the menu settings! Sounds like a direct contradiction doesn't it. But the point is that if you have a newer radio, you need to dig into those menus to get the best performance. And you have more knobs to adjust. Older radios made lots of assumptions in their design, and fixed various settings in hopes that it would suit you. More often than not you can adjust a new radio to suit you as well.

The biggest gripe I have is that you really need to spend a bunch of extra money loading up most receivers with proper filters to really get them to show what they can do. A stock FT-1000MP Mark V and an FT-1000MP Mark V loaded with roofing filters, etc. are like two entirely different radios. And you can often improve almost any radio with some good outboard devices. I still use an old (analog)Datong FL-3 on most of my radios because it works better than just about any DSP system I have used. Fortunately, I don't need to use the FL-3 all that often, but when I do, it is a crackerjack device.

So, don't give up on the FT-897 if you haven't really explored all your options and settings. But if you still can't get it to do what you want it to do, then maybe it's time to whip out the old credit card!

From: Charles Scott
Topic: 16992 Message: 17003

All:
One other thing to note is the susceptibility of the FT897 to overload of the front-end switching diodes (as I detected a while ago). This seems to manifest as splattered noise from, and additional images of, local AM broadcast stations and occurs when the antenna system is sensitive to lower frequencies.
I haven't had a chance to get into the rig to determine what components aren't properly biased in receive mode, but it's clear this is a problem. Turning off the preamp will simply reduce the level of all signals and the interference the same amount. If you start padding the input (like with a variable attenuator) you'll notice that this type of interference starts to drop off drastically at some input level. The fact that the preamp has no effect on it means that the problem is before the preamp.
If anyone has any additional information on this, please say so. One of these days I'll get time to properly diagnose the problem down to the component.

It may be a little unfair to compare my 897 to my FT1000 (pre D) but the 897 is supposed to be based on the thou's successor the MP and so one would have thought it would be at least as good if not better?

WRONG!

Compared to almost every other radio I've used the 897 sounds like a cheap CB. In fact I've used CB's that sounded better. Even with no antenna connected the 897 just sounds cheap. It does sound much better with the IPO set but then the signals drop so loose / loose on that one.

I've only ever messed with DSP in the shop and never been impressed enough to buy it so I'm no expert there either but I've messed with the 897's a bit and well... I'm still not impressed.

So far the only thing I've found on the 897 to better my previous bedside radio is a digital display and the internal batteries.

Not much of an advert but I still love the "idea" of the radio.

Just another of my 2p worth

My FT-897D compares very favorably with several older rigs which aren't synthesized, FT-101ZD, Ten-Tec Cosair and Ten-Tec Delta 580. All of those use heterodyne crystal oscillators which is inherently a quieter design. There are radios with better receivers on the market than the 897 but they will cost you about three times the price or more

I bought the 897 because of its multi mode, multi band capabilities, it is very harsh to compare it to the higher priced radios, especialy base station radios, this little radio is working fine for me as a base and mobile radio while i convince the wife that the MP Mkv i'm about to buy is going to be a great addition to our household , like i posted earlier my only real problem is the signal to noise ratio.

As regards the comment about CB radios; this is also a little harsh, a lot of hams cut their first tooth on CB myself included, CB can be the first rung of the ladder, then people move onto 11 meters SSB learn a little about radio ettiquete and the possibilites of communication via propogation, by this time they will normally have a converted HF radio so listen to Ham bands, the next step is for them to take their ticket and work the bands.

If the comment was regarding CB radio spec's then he was quite right, my Cobra 148GTL at the time to me was the best thing since sliced bread, then i got myself a FT 101ZD and the rest is history for me, but to compare a 897 to a CB is like comparing a manual screw driver to a Craftsman 19v Screw gun.

Oh if i sell my house and live in a trailer then maybe i can afford one of the 5 figure radios, i don't hear many operators using them, maybe if we all had gone out and purchased these radios then the next generation would have been 6 figure numbers.......... just Yaesu and Icom trying to find the ceiling of what we will pay for radios, they know now that we dont have deep pockets, hence the FT2000.

Thanks Guys

I am looking to the group here for some help. What I really need is an elmer.

I don't have a lot of experience with digital communications with radio.

Here's what I want to do I want to build a ct-39a cable to interface to my computer for psk-31. I would also like to use other modes. When I ordered the cable I "assumed" it would be pre wired with a rs-232 connection and two audio cables.

Looking at the diagram below it appears that PTT and GND should go to the serial interface. What pins?

Data in is audio so this is the audio out and ground.

Is 1k2 data out the line in with another ground connection?

I have no idea what to do with squelch.

As you can see I just don't have enough understanding to use the layout in the manual to build what I need.

Any help is appreciated.

K6WRJ.

PS I have my computer setup to recieve psk-31 now through the head phone jack.

You right Kent. I don't know who told this guy he knows about ham radio. What he said is way off of reality. This is a truck driver speaking, with 18 year driving a big rig and using different CBs and Sport radios and Yes i am ham operator and i have A MRK V and 897D and looking into of the FT-2000.

I have both an FT-1000MP Mark V and the FT 897. While the Mark V is better in many respects, the FT 897 stands up pretty well against it, within its obvious design limitations. I have been very happy with my 897 and I find it to be a perfectly satisfactory portable or base station rig.

Before I bought my 897 I did a side by side comparison at the dealers, on the same aerial, of all their available display models. This included an FT1000 and an TS7000.

There was no appreciable difference in the noise from the 897 to any of the other radios on offer, both in terms of sensitivity or noise floor.

I am not expecting the 897 to perform quite as well as say an FT1000 in terms of large signal handeling, but when I tuned close to very strong stations the difference was not great.

On 80 and 40m particularly the noise floor is set by external noise coming down the aerial. so the receiver's noise has very little do do with things anyway, being swamped by at least 20db. You could have a very noisy receiver and not notice on these bands.

Regards
Jeff

Good morning to all,
after reading some "strange" opinions about the argument, I feel the need also to express my point of view that's very near the one of Roger.
While I cannot compare with a top class rig (unfortunately !!) my 897d bought abt. 2 years ago, if I remember rightly, and used regularly in HF using all modes from SSB, CW, PSK, RRTY, to SSTV, VHF (SSB, FM and packet)and UHF (only FM for now !), I can honestly say:
Against the former radio for the same portable and similar operation I used previously (Kenwood ts890s) the Yaesu compares usually at least the same but many times better.
While I can agree with the opinion that the dsp is very rarely a real help in ssb signal digging, I found it VERY effective in cw and digital modes. The DNR and DNF not outstanding but many times useful, the noise blanker usually useless. So very good the if shift on passband. No birdies of real importance.
Dealing with sensitivity and expecially noise (internal) level I will say a COMPLETE OK, selectivity good, overloading very rarely noted and completely avoidable with some IPO or rf manual lowering !!.
No birdies of real importance.
Power output NEVER 100 watts but very near on it (80 to 90) on hf.
Sometime I use an external old NIR-10 dsp processor. Good improvement, but no REAL need to bring on the field.
The only modify was on the stock mike. I installed an internal (german ham made) rf speech processor that comes also with an electret capsule.
A little better tx audio and much better punch with compressor switched on (rarely).
I use also an external small speaker.
73 to all of you
Silvio

I am not sure that you sent this post after my infos and opinion abt ft897 when I said that only modifies where,for me, the mike capsule replacement.
In any case this is the link where I got the small rf processor
http://jwm.de/afu/0ft817eng.htm
Usually I build and modify miself beeing a pretty good ham brewer, but it wasn't the case because I asked the designer to "work" for me that time !

This pretty much matches my experience, though I do personally see noticeable improvement in receivers costing over US$1,000. Which shouldn't be a surprise to anyone <g>. But compared to units under $1,000 I do not see a material difference _as_long_as_ the unit is configured properly for the mode in use. If you configure the FT-897 for FM work and then switch to HF SSB without changing the settings the reception will be horrible in my opinion.

I suspect that the poster that prefers his CB either just needs a few pointers in properly configuring the equipment or had a defective unit.

The only real quality weakness I found with the FT-897 was the speaker. A cheap external speaker is the first addition that I recommend owners to purchase.

All:
I wonder if some of the disparity in the results we're hearing from different 897 users is due to the problem I mentioned with signal overload on some input component. If a person happens to be close to an AM broadcast station or other strong HF source (and depending on the antenna they use), they may have the problem and it may affect their receive performance. If they aren't they may have perfectly good performance. Also note that this problem is NOT solvable with IPO or RF sensitivity settings! It WILL look like band noise or weird trashy signals around the band. Since most other good radios don't have this problem, a comparison between an 897 and another radio in such a case will not fare well for the 897.

All I did in this thread was voice an opinion about how I found the RECEIVE performance of MY FT897 (which, in the very first line <<It may be a little unfair to compare my 897 to my FT1000>> I clearly state that I own) compared to other radios I also now or had previously owned or operated.

I thought this was in the spirit of both the group and this particular thread.

I did not expect to be called ludicrous by someone who had hopefully misread possibly misunderstood and obviously mis judged me!

So I said I'd used CB rigs, what of it? How on earth does that say it all?

Throughout the course of my radio life I have used military radio, private mobile radio, short range business radio, broadcast radio, radio telephones, field phones, fish phones, megaphones, radio microphones, and two tin cans on a piece of string and none of that "says it all" or even part of it.

I'm sorry I joined the thread now but to reiterate more simply, in my humble opinion, the RX Audio from MY FT897 is not very nice.

"" MINE HAS A SPEAKER ON THE TOP SIDE OF THE RADIO....""

IS IT PICK ON ME DAY OR WHAT?

Mine has a top mounted speaker as well but the operating situation
requires a forward facing one. As the radio has no controls or
readouts ""ON THE TOP SIDE"" I figured an external speaker would make
a good second choice.

Not that I agree with the original poster's logic about portable antennas, I think the issue was more in reference to access to the external speaker jack.

Depending on the RF power level, I see no reason not to use a "back of the radio" antenna. While I agree it will probably not perform as well as a simple dipole, there is nothing fundamentally wrong with it.

For QRP, and/or quick setup to air, where is the problem?

I run an external speaker with my 897 too - although there is little restriction above the radio, the internal speaker in such a small, cramped rig is small and does not have the greatest audio even for a communication (rather than hi-fi, before anyone jumps on me too!) receiver.

17033. RE: [FT897] Re: Older rigs receive audio vs 897

Yahoo group: FT897 (2007)
Date: 2007-01-25 11:55:31 UTC
From: Mark Vaughan
Topic: 16991 Message: 17033

The THD on both the 857 and 897 is very poor. You really notice this as you increase volume to get over vehicle noise when mobile.

If you take the speaker output, and pop a 600 Ohm 1:1 transformer on it followed up with your own better audio amp and speaker you will find a massive improvement.

As you reduce the loud speaker load you will find the THD drops, so you can now use full volume range from the radio and get really nice audio out.

I run an external speaker with my 897 too - although there is little restriction above the radio, the internal speaker in such a small, cramped rig is small and does not have the greatest audio even for a communication (rather than hi-fi, before anyone jumps on me too!) receiver.

I really have not had any problems with receiver noise. I have been very, very satisfied with the 897D. Plenty of power, very quiet, the DSP works great, the filters are accurate. Just a wonderful rig and well worth the money I spent for it.

17035. Older Rigs vs 897 & external speaker (new topic)

Yahoo group: FT897 (2007)
Date: 2007-01-25 13:22:59 UTC
From: kc0nro
Topic: 17035 Message: 17035

All,
Thanks to each and every one of you for your responses to my question comaring older rigs receive to the 897...I have made some of the suggested changes and they have helped...

Now, I have been eyeballing an external speaker. I currently just use the speaker of the rig...

Does anyone use a speaker like the Gap Hear It or something similar? What has been your experience with it? Is it worth the money? How does the DSP on that speaker compare with the DSP of the 897? Is it recommended to go and drop $160 on it?

Have a hamfest on Saturday, so I'm looking for something...at least an external speaker of some kind that will sound better than the factory 897.

Again, I really enjoy my 897...the performance for the money can't be beat. That's why I am wanting to go the little extra mile to make it sound like I want it to...

Many thanks in advance and 73,

JOHN

Topic: 17036 Message: 17036

I have always said, if you want to COMPARE radios, use them on the same antenna,(Move the antenna cable from radio "A" to radio "B") and use the same (External) speaker or headphones! It is possible that a noisy LOCATION for the antenna can cause what looks like poor radio performance, and the small internal speakers are not the best, but if the radio is to be small, where would you put a BIG speaker? The WORST antenna situation, radio-wise, is generally the INDOOR antenna, or an antenna within 30 feet of the radio and/or other electronic equipment, such as TELEVISION SETS, COMPUTERS, POWER SUPPLIES, BATTERY CHARGERS, and LIGHT DIMMERS--all of these items have been known to radiate NOISE into receivers. Antennas that are NEAR the radio are also likely to adversely affect the radio during TRANSMIT, if the R.F. finds its way back into the radio by way of the mike cable, computer interface cables, speaker/headphone/soundcard leads, or, it may even affect the power supply! Put a good, properly designed, resonant, low SWR beam antenna on top of a 75 foot tower, 50 feet from the house, and fed by good, properly terminated coaxial cable, with proper grounding, on the radio, and MANY of the users that say "My radio is noisy" would have a different opinion. Unless you have the other radio there TODAY, and can switch them back and forth on the SAME antenna and cable, statements like " my old #XXXXX was so much better" do not mean much! Tell us HOW you come to these conclusions in the future, and perhaps a more valid solution can be developed, if there is a problem. 73, KC3VO-Bob Curry

I ran my 897 and my 900 side by side for nearly two years. Same antenna, PSU, location, QRM etc etc. The only difference was the patch lead from the antenna switch to the rig. So I can honestly say that in my opinion the old FT-900 is a better HF rig than the FT-897. It wasn't a decision I wanted to make as it meant I wasted 1000 UKP... I really wanted to prove that the 897 was worth the money. Sadly it wasn't. Even the tiny 817 was a better RX.

As for speaker size... The 817 is a tiny rig that sounds much sweeter than the 897. If it can be done in the 817, why not the 897?
If you look at the way the speaker is mounted in an 817, you will see that it is ofset from the grill. This isn't an error. It was done to improve sound quality. The FT-817 is Yaesu at their best!

Hi Leandro and group,

I also have an FT1000MP at home, an FT100 in my car and an FT817 in my backpack and I am buying an FT897D tomorrow to use as a powerful portable in my holidays. I have heard and compared a borrowed FT897 to other radios and found it as good or better.

I have not compared it with my own radios but after reading this thread I am convinced it is a good radio so I am going for it tomorrow morning!

Thanks guys!!!

Yahoo group: FT897 (2007)
Date: 2007-01-24 02:17:21 UTC
From: Clint Chron
Topic: 16991 Message: 17043

Perhaps we are not keeping everything in perspective. I have a FT-857D and a FT-897D. For the money, these are the best rigs I have ever owned. Over the past 45 years in ham radio, I have used a large number of different rigs (and owned a lesser number). This includes the famous Collins S Line, the 75A4s, the R390s, the Hallicrafters, the Swans, the Drakes, the Heathkits, etc. I have also owned some of the first solid state rigs - Atlas 210X, Davco DR30 receiver, Swan MX100, and have also owned some of the more recent solid state rigs such as the Index Labs, SG 2020, FT-817, etc. They all have their bright spots and their problems.

I bought my first SSB transceiver back in 1963 - the Drake TR3. The total new cost was $600 with AC power supply. It only did 80-10 meters, used tubes that had to be replaced, bowed out the top cabinet when transmitting, drifted, and had zero features on the receive side. Back then, I was thrilled to have it. However, in today's dollars, I guess this rig would have cost me around $2500. So for $675, I got a FT-897D that covers all HF, VHF, and UHF bands, has many nice features on the receive and transmit section, is very small in size, has a very stable VFO, etc. To me, that is a real bargain.

The receiver overload problem is always going to be with us. If you want to give up receiver sensitivity, then you can have better signal handling capabilities. If you want to pay more dollars, you can get an even better receiver.

17044. Wideband/MARS mods

Yahoo group: FT897 (2007)
Date: 2007-01-25 19:21:06 UTC
From: von_landstuhl
Topic: 17044 Message: 17044

I'm a no-code Tech and I'm planning to make an FT-897D my first HF rig. I'd like the radio to operate on MARS frequencies, but I'm also in the state guard where we have several freqs just below the 2 meter band (around 141-143 MHz).

I've been reading about some of the mods for the radio and I'm a bit confused. I've found three different versions: one talks of shorting pins 1, 2, and 3 of Q1049, another talks of moving jumpers, and another says do both.

Are the terms "wideband" and "MARS" being used interchangeably for the same mod or are these two different things?

Can someone provide some definitive info on what frequencies are made available with the different mods?

Thanks,
Joe

From: o22sail@yahoo.com
Topic: 16991 Message: 17047

Hi gang,
My FT- 897D is just plain noisy compared to my FT-107M. These are the only HF radios I own at the moment. I tend to use the 107M for casual listening and ragchewing on 10m though 80m. I use the FT-897D for everything else. I really find the 897 easier for me to operate because I'm used to the menu system and I'm more comfortable with its much finer tuning.

But, as far as listening enjoyment...the much warmer and quieter ft-107 is the hands down winner. I like both of them for different reasons.

Interesting - I also have an FT-817, and am happy with audio from the internal speaker.
Might try shifting the speaker in the FT-897, however, as it's my 'backup' hf rig (used at least 70% on vhf/uhf) I may just live with the external speaker...

From: minicat0904
Topic: 17049 Message: 17049

I need a ground on TX to switch a transverter. Looking at the manual, which is rather vague, it seems to be available on pin 2 of the CAT/Linear 8 pin miniature DIN. I have tested the condition of this pin with a voltmeter and it seems to be at ground all the time. Do I have to provide a pull-up resistor or something to get a true ground on TX? Or am I missing something blindingly obvious?

You will have to get used to menus and the ability to configure far beyond the 101. More bells and whistles, most of which you don't need to use, or will set and leave. Beyond that, there isn't a lot of difference.

I agree that there is not enough volume out of the 897D for good mobile operation. The solution I found was to purchase a Motorola powered speaker off eBay and use it external. The speaker I like is the model NSN-6027a and you frequently see them for sale. You can find them for as little as US$5.00. I recently bought three new ones for US$10.00 each. It provides more than enough audio for a noisy environment with good quality and the volume control on the 897D turned down in the lower part of its rotation. In my opinion, this is the best way to get loads of clean audio out of your radio without spending a fortune.

I have uploaded the PDF file containing the connection diagrams for Motorola powered speakers to the file section for the group in the folder "External Powered Speaker" and the file name is "motorola_amp_spkr_mods_20060202.pdf".

The D version also has 60M. A nearly useless band in my opinion, but
some are using it.

Or even better:
How about comparing the FT897 with the IC706MK II G (=smaller) or
with the TS 480SAT? (I know: No VHF-UHF)

From: Mark Vaughan
Topic: 17036 Message: 17055

It seems many f the older rigs are better or at least at HF

I started with two FT767's, I have my FT857D, and an FT847

The newer radios are easier to use, really the 857D is more of a mobile radio, audio needs a lot of work, and the DSP isn't impressive. It's major advantage is that I can drive to a better location within a mile or so and get so much further.

The FT 847 is much better, DSP works well, and is easy to adjust with simple knobs, but if I want to go HF DX, from home it has to be the Ft767 and linear the difference remarkeble.

Sort of makes one wonder whether an old Ft101 could be better, and why people might be spending so much money on the FTDX9000's. All our newer radios received good reports and every one had to have one when each came out, but are they truly better. The only thing I see is ease of use, and memories which makes working the repeaters so much easier.

> much!

I ran my 897 and my 900 side by side for nearly two years. Same antenna, PSU, location, QRM etc etc. The only difference was the patch

lead from the antenna switch to the rig. So I can honestly say that in my opinion the old FT-900 is a better HF rig than the FT-897. It wasn't a decision I wanted to make as it meant I wasted 1000 UKP... I really wanted to prove that the 897 was worth the money. Sadly it wasn't. Even the tiny 817 was a better RX.

As for speaker size... The 817 is a tiny rig that sounds much sweeter than the 897. If it can be done in the 817, why not the 897?
If you look at the way the speaker is mounted in an 817, you will see that it is ofset from the grill. This isn't an error. It was done to improve sound quality. The FT-817 is Yaesu at their best!

I agree completely with the noise level.
Have my FT897D for three days now. When I switched it on, I thought:
"My gosh; it must be in FM mode with the squelch open." But it was on
80m LSB. A constant S8 noise level. Same on 20m. I played around with
some results:
On strong signals (1 MHz. BCL and on 9.5 MHz. SWL) it behaves as it
should: Switching on the ATT gives abt. 2 S-points less.
Switching off the PreAmp (= Switching on the IPO) gives abt. 1-2 S-
points less. And on 1 MHz. between stations the S-meter goes to 0.
HOWEVER: On 80, 40 and 20 the constant S8 noise falls off to S zilch
when I switch on the ATT. When I switch off the PreAmp [IPO on] the
moise floor drops to abt. S7. As well on 9.5 Mhz. SWL between
stations the noise drops to S8 and with the ATT on to S0.

In three days a haven't been able to decode one callsign on 80 or 20.
On 40 some S9+ QSO's were heard. Denmark, Germany, Spain.
As it is, for me the set is useless on 80 and 20. It is a good MW BCL
box. Anyone want to buy one?

BTW: I live in a rural area.
And: I do know the S-meter is not a scientific instrument.

Another thing to consider is that the receiver sensitivity on the 857/897 can never be used to the maximum available. I have measured < 0.2 uv on my two radios. The antenna noise on the HF bands far exceeds that sensitivity. If you turn off the front end receiver amp, then the antenna noise will decrease and the receiver's overload response will be improved. You can look at QST's expanded test results to see how the results of doing this.

Hi all,

PA0VDP, I think your FT 897 D needs a check-up on 40 and 80. My dear old FT 897 receives right on this moment (13.44 UTC = 14.44 LT) on 3760 khz a qso between two UK hams with sigs between S7 and S9.
Of course there is some noise on the band but that noise doesn't give any indication on the S-meter.
Condx: 20 m long dipole with tuned feeders. Condx of ant wire: very bad, lot of corrosion; had to repair it after last weeks gale and will have to replace the wire in spring. And I live here, on the west coast of Holland, in a very noisy industrial environment...
And as for the audio: a simple external speaker encased in a little box made of wood gives me a reasonable good audio quality...

Enjoy hamradio!

The sudden drop in noise, to me, seems to be a sure indication that the receiver is being overloaded. Whether this is due to a fault or just a very strong in-band signal I cannot say.

This would certainly explain why some people do not seem to have a noisy receiver and others do.

It would appear that switching on the Attenuator also switches off the pre-amp. Doing a few quick experiments on 80m this is about the same as adding 16dB of external attenuation compared to IPO and ATT both off.

So be careful when doing your tests, the attenuator is about 10dB and switching out the preamp is about 6dB. Observations on my 879 shows that with a noise floor of about S7 (IPO & ATT off) will drop to Zero when the ATT is switched on. This is also the case when 16dB of external attenuation is applied. Stepping the external attenuator shows a smooth change with attenuation.

There is nothing in my results that indicate that the S7 noise floor is anything but external noise coming down the aerial.

Comparing things to a high dynamic range military grade receiver on the same aerial shows no difference in either noise floor or sensitivity, which appears to be limited purely by the received external noise.

There is some difference between the tone of the 2 receivers, but by varying the bandwidth of the DSP filter is is possible to make the 2 radios sound quite similar.

Where do you live? Since you do not give/have? a ham callsign, I cannot look you up, but from your report it is very likely that your radio is getting overloaded by a strong LOCAL signal source, such as a radio or TV transmitter. That would account for the attenuator having the effect it does. Tell us more about your LOCATION, and I will attempt to do more research.--73, KC3VO-Bob Curry (Adelphi, Maryland-USA)

In my QTH i have no problem at all and i live west of the city but into the city(Albuquerque, NM). My antenna is a three element beam from HY-GAIN and i do some good DX. If i turn the RF GAIN wide open my S-UNITS are S-0 with the preamp on WITHOUT ( ) AROUND THE IPO (MFm). I always keep my RF GAIN about two S-unit closed and when i have more than that is because condition and not cause the radio is not good. My antenna is resonance for the band that it is made for with a SWR of 1.1.1 to 1.2.1 depending the band in the center of the voice portion and i use a ATU for the CW portion beside that i only have about 1.8.1 to 1.9.1 on CW without ATU. But i know that the radio fold back its power after 1.5.1 and there i use the ATU. Maybe you should work on the antennas, connections and so many other details that affect comunication and give you all those noises. There are radios more sensitive than others to pick up noises and some time we need to work out those little details to make it right.

My 897 replaced a homebrew 4 band DCRX in the next room, built from kits about 15 years ago. The DCRx sounded better and picked up far lee interference.

That system does indeed run on an indoor antenna so, to give it a fare test I brought the 897 through here to the shack and gerry'd it to the outdoor wire from the thou.

Sorry like! It did improve dramaticaly but it still sounded cheap.

I think you're right.
I was already thinking about packing material in order to ship
my FT897D back to jbe. I left all the stuff outside as we mostly do
and -of course- for the first time in seven weeks it started to
rain. Pouring! So nothing left but a pile of . . .
I'm afraid there is more wrong than just 80, 40 and 20.
I did some more 'tests' with these results:

On 100 kHz the set is quiet. Not silent: some noise but S0.
Around 140 kHz the noise starts to go to S7 at 760 kHz.
Higher up still growing until it 'peaks' around 4 MHz: S9.
It stays at abt. S8 until is goes down around 43 MHz.
to S7 at 56 MHz.
76 - 107 MHz. is OK but . . . no FM broadcast stations!
118 - 137 MHz. is OK but . . . no airplanes!
137 - 164 MHz. is OK but . . . no hams!
420 - 470 MHz. is OK as well but . . . no hams as well.
"OK' means: S0 and the usual VHF/UHF noise.
Guess I should start worrying about the VHF-UHF performance?
While 'tuning' over the 2m and 70 cm bands in 1 MHz. steps I
can clearly hear that the typical U/VHF noise is higher in
the amateur band frequency span than at the edges of the
ranges, thus the bandpass design can be heard.

I've seen your QTH, Karel, and it is definitively an industrial area.
My parents lived in your city just after they married (I've been
told.) But that was before WW II.

I think I should've signed with EA/PA0VDP because I'm in Spain with
my caravan. That's why I would like to have a 'portable' transceiver
and choose this Yaesu thing.

Not with this FT 798 :-(

Let's see what some of the other om's come up with, before
I have to send my FT897 some 1500 miles across Europe.

Hi Curry,

My Maidenhead locator is IM97KP; or, to be more precise:
QTH = 1° 8' 13" West, 37° 38" 9" North.
That's about 12 miles west of Cartagena, Spain.

I wouldn't know of any big transmitters in my neighbourhood but I've
been living here for only three years. It could be a military
establishment somewhere in the mountains because the aerials can
clearly be seen on top of several hills. And Cartagena is an
important harbor for the Spanish Navy. But then, I guess military
transmitters cannot be found in the databases you intend to consult?

Nevertheless I'm mighty curious what you can come up with!

TIA and 73, Ad EA/PA0VDP

Ha Bob here's another little thing to be aware of. We are all aware of the BPL problems on the power line system. Think we have dodged the noise.......WRONG I suspect alot of people do not know that this technology is in use now and growing. I live in a Naniamo, BC with 75000 people in town (not big place really) . But here we aready have 4 motel and Hotels using this system to feed they customers internet on their property. Think that does not add to the already poor band conditions. My noise has increased over the last 10 years and that is about all I can put it down too, a very hard condition to try and trace or prove (spectrem noise). But blaming the radio's is sure a good smoke screen for the unexperienced to use. It's easy to find out if you may have the problem around you, phone the business in town and see if they offer the service. I'm sure they will say it works great.
After that, figure out why your new design radio has noise compaired to the old designs is easy to understand.

I think switch mode supplies are one of the biggest issue with background noise. Over the last ten years they have become cheap, every little transformer supply is now switch mode, now every one has a phone with one, a PC with one etc etc.

There is a technical college about a mile from me, everytime they put a new room full of Dell computers, up goes the background noise. In this environmentally challenged time, they don't even ever turn them off except in the holidays, they say it's because several won't come back on again.

One college in Falmouth gave a close ham S9 on all bands when they fired up their new computer suite, the ham complained but the college didn't know how to fix it, so the ham has given up and sold his kit. This is very very sad.

I was worried about heavy noise increases when the higher frequency broadband telephone systems came in, but as long as balanced pairs are maintained there aren't too many problems, and BT have actively hunted for unbalanced system, normally a cheap Chinese phone hangng on the line with a bad filter cap.

We have stronger EMC laws over the past few years, but despite this the quantity of emitting kit has increased that much our noise levels have risen substantially. If you also put this in mind with the fact we are in a sunspot low so we are only getting short range interference, I do wonder whether coms will get better or impossible when we get our sunspot hi. In theory the signall to noise shouldn't change, but many times theory falls over a little especially when you are playing RF.

I owned an FT-101-E. A lovely bit of kit. The RX was as wide as a barn door, but it had a wonderful tone to it. Nothing sounded harsh on a 101-E :) I did my first CQWW SSB on mine... Talk about hard work, especially working the splits with the external VFO and anologue dials!!! The TX side of the 101-E was superb though. There are not many rigs around today with such a good TX quality. That's valves for you :)

The 900 is a LOT easier to use than the 897. It's all on the front panel. No menus, no scrolling... You want to do something, hit the button or turn the knob. The only setting on the rear of te rig are for TX audio, proc level, VOX gain etc., Everything else is on the front panel. It also has memories.... It also has DIRECT ENTRY for quick QSYing, and one press band selection, each band has it's own button. The 900 doesn't have DSP, but it has a very effective notch and shift.

I rarely use V/UHF as it's too full of muppets these days. I do miss 100W on 6M though, but being a mainly QRP op, I'm happy not to have the temptation :)
The 900 was designed with mobile operation in mind. I'd love to get hold of the seperation kit. If ever I do, I'll buy a second 900 for the motorhome.

I've often been tempted to buy a 920 or some other similar rig, but I feel that I'd be spending a lot of money for not a lot of gain. The only thing I would like is twin RX. That's the only thing that could tempt me away from the 900.

The 897 D has the 60 M built into the first five memory modes.
Allocation on 60 M is very, very narrow so Yaesu build in a thermal
stabilizer for the frequency oscillator to minimize frequency drift as
ambient temperatures change. I believe that there were a few
enhancements to the DSP as well.

I too had to decide between the "D" or not. I considered the two equal
in all regards but I was looking at purchasing a used Ft-897 (no "D")
versus a new FT-897D. The fact that Yaesu does not transfer warranties
between owners tipped the scale for me in favor of the new 897D. I
would have purchased a new 897 (no "D") as well but they do not offer
those anymore.

Minus the 60M and the required TCXO (thermally controlled transmit
occillator) they two are equal.

17075. FC-30 behavior question

Yahoo group: FT897 (2007)
Date: 2007-01-26 18:51:32 UTC
From: Lew Phelps K6LMP
Topic: 17075 Message: 17075

I acquired the Yaesu FC-30 tuner along with my used FT-897D. Despite its well-discussed limitations, it is functional to some degree. I've been using it in a mobile setup, feeding into a Hustler vertical mounted on the back end of my Prius, on a steel bracket bolted directly to the frame.

Here's the question. On many bands, but especially on six meters, the FC-30 will grind and whir, and then report "high SWR". But when I key the transmitter, my LDG meter says the SWR is not all that bad-- sometimes as low as 1.5:1. It appears to me that the 897/FC-30 combination will report "HSWR" if the tuner reaches the outer limits of its tuning range as it attempts to tune, whether the SWR is really that high or not at the outer limit. Can anyone verify this theory?

Even more oddly, sometimes the tuner will "find" an acceptable set of settings on portions of the 6 meter band (mostly below 51 mHz) . At other times, it can't find a setting on the same frequency, even when on the same antenna and coax connecting the antenna and tuner. But sometimes it will find a match as high as 52 mHz. Any ideas why that would happen?

thanks and 73

Lew K6LMP

I thought something was wrong with my rigs at the house. They all had about S7 to S9 noise levels on 40 and 80 meters and I could hardly hear any SSB signals. I purchased a cabin up in the mountains (about 6500 feet elevation), put up the same Cushcraft R6000 vertical and started taking my rigs to the cabin. Up there, 40 and 80 was very quite and I could hear all sorts of SSB signals.

ATT
> both off.

You are completely correct:

The ATT is 10 dB. It says so in the manual but it can also be
calculated from the 27 Ohm-35 Ohm-27 Ohm T-attenuator circuit.
Whether the PreAmp is 6dB I wouldn't know. I couldn't find it in the
manual.
It is a bit of a funny circuit and I guess the gain is decided by
the
transformer turns ratio between collector and base of the grounded-
base transistor.
At least it is confirmed by my S-meter readings, be it around S7 or
in the S9+30 dB region: IPO on or off equals 6dB or 1 S-point.
Combining the two functions is really done sensibly (*in a way*):
The
combination 'ATT on' and 'PreAmp on' is not possible. That can only
be seen from the circuit diagram: the three options 1°through,
2°preamplifier on and 3° attenuator on are wired in parallel and by
some DC-voltage joggling mutually exclusive. This means -as you
said:
Switching on the ATT gives a 10 dB or a 16 dB step, depending on
whether the PreAmp was off or on, respectively.
Mind you: THE FT897D DISPLAY SAYS OTHERWISE! In MenuFunction m the
option [ATT] on and [IPO] on is not possible.
The decision to switch off the preamplifier when the attenuator is
switched on must be made by the microprocessor, because the DC-
voltage routing doesn't show that.

My measurements only partly agree: The 'ATT on' step is -quite
consistently- 20 dB and not 16. Again, whether I am in the S9+30 dB
region or around S8 signal strength, the delta is abt. 3½ S-points.

> So be careful when doing your tests, the attenuator is about 10dB
and
> switching out the preamp is about 6dB. Observations on my 879

shows
> that with a noise floor of about S7 (IPO & ATT off) will drop to
Zero
> when the ATT is switched on.

That is precisely the case here (except the noise sometimes goes
from
S9 to Zero) and it worries me quite a lot.

> This is also the case when 16dB of
> external attenuation is applied. Stepping the external attenuator
> shows a smooth change with attenuation.
>

Did you really try an external attenuator? With a signal generator
or
with your noisy enviroment? The least I would conclude is, that the
S-
meter isn't worth a Jig below S8. (16 dB = 2½ S-points). Which does
happen in many transistorized receivers, btw.

> There is nothing in my results that indicate that the S7 noise
floor
> is anything but external noise coming down the aerial.
>

OK again. Without antenna my set is clean. AF volume completely
clockwise gives just the receiver noise (which increases a little
when the PreAmp is switched on (=IPO off)).

NOTE (*in a way*)
My design option might have been: Put the attenuater in series with
(and in front of) the preamplifier and make the attenuation some 12
dB. That would give three nice 6 dB steps. But putting the two in
series means -in this design- however, putting 6 switching diodes
between the antenna and the double balanced mixer and that would
have
meant GTF even for Yeasu Engineers!

> Comparing things to a high dynamic range military grade receiver
on
> the same aerial shows no difference in either noise floor or
> sensitivity, which appears to be limited purely by the received
> external noise.

I took a wheelbarrow and brought my Drake TR7 to my shed in the
woods
and it's sitting right next to the FT897D. Not a military grade
receiver but one of the better ones with regards to 3rd order IP.
First impression: a noise floor of S2-S3. I'll have to report on the
readability of ham stations. Later.

HI !
I've notice the same thing with mine.Sometime,the SWR is resonnable
on the meter and if i press the TUNE button,the FC-30 shows HI SWR
and would not start a cycle.Strange behavior in fact !

You are right about the limitations of the FC-30.3:1 SWR at best.
However,it serve me well here with my MA6V antenna.I have full coverage
of the bands it is designed for.

I am curious to know if someone was able to use the FC-30 with a G5RV.
I have been tried a vetical for the low-bands but the local noise was so
high that i finally sold in search of another solution for my small lot.

Comments welcomed.

17080. Noisy radio

Yahoo group: FT897 (2007)
Date: 2007-01-27 15:56:34 UTC
From: Rod Schrivener
Topic: 17080 Message: 17080

I have been watching the comments going back and forth for a few days concerning the noise when using the FT-897. I have a non-D model and would like to offer some observations.

In over 50 years of hamming, I have see many changes and improvements in the radio equipment we have at our disposal. Today almost everything we use is solid-state, and optimized for the type of audio signal that will give us the maximum punch on the bands. For this reason, most of our receive audio does not sound as good as it did in the past. Early equipment used tube-type amplifiers, and most had larger speakers, and with the exception of some then very expensive equipment,had a fairly wide bandpass in the receiver. They sounded pretty good.

As to the noise problem in the 897, There are many external factors that come into play as well as the design or capability of the radio. I live in a rural area, very quiet Rf-wise, buried utilities, and all the things that you would think make it great. There are times when I get s7 noise on the HF bands. Interestingly enough, I found that the major source of noise was the "intelligent" battery chargers for my 18V Craftsman portable tools. Once the battery reached full charge, and went to the trickle state, the charger produced noise. It had to be unplugged from the outlet to get rid of it. I also found that other chargers for ni-mh and li-ion batteries do the same thing. Also if you have one of the telephone company remote digital cabinets hear you, they produce a lot of HF noise for a block or two.

The bottom line is that there are a lot of sources of actual noise out there that can cause the problems some are having. You might be surprised what you have right around the shack generating a good bit of noise. I generally try to locate external sources before I start on the radi oitself.

Good luck to all

73's Rod, W5GZT

17081. Menu Numbers 2 Through 4 Unavailable

I have used the FC-30 with a G5RV. It did not tune in on many of the bands due to the limited tune range capability of the unit. It tuned in 80/75, 40, 20 and on occassion it would tune in some of the other bands. With all fairness to the FC-30, some of the problems with tuning in the other bands dealt with coax and antenna.

Best Regards,
Doc KD8BGQ

17085. Re: [FT897] Re: FC-30 behavior question

Yahoo group: FT897 (2007)
Date: 2007-01-27 16:28:43 UTC
From: Johnny Burroughs
Topic: 17075 Message: 17085

Hardware:

Yeasu FT-897D

LDG AT-897 Tuner (not and FC-30 but similar problems)

AV-640 Hy-Gain 8 band vertical antenna

Problem: 6m Band and LDG AT-897 tuner.

Scenario 1:

Rig tuned to a 6m frequency via LDG AT-897.

SWR 1.3:1.

No Rx audio.

Did not QSO during Tx (only depressed the PTT)

Scenario 2:

AT-897 by-passed. (Quick depress of the Tuner button)

First time Tx after by-pass - SWR is 1.3:1, First time signal Tx good.

Rx Audio is good.

Second and thereafter Tx, SWR is HSWR and Rain on Tx signal, audio remained good.

Scanario 3:

AT-897 Removed from circuit, Antenna connected directly to the rig

SWR is 1.5:1 (yes I do need to adjust the antenna but forget that for the moment)

Rx Audio is good (as in Scenario 2)

Tx is also good.

My observation, as has been that of other group members in the past, 6m and the LDG AT-897 tuner does not work. Since making this observation I have decided to only use the tuner on a long or random wire for portable operation. A correctly tuned base antenna will in future be connected directly to the rig. Perhaps not a bad thing.

17088. Re: Menu Numbers 2 Through 4 Unavailable

Yahoo group: FT897 (2007)
Date: 2007-01-27 17:10:58 UTC
From: Robert G. Schaffrath
Topic: 17081 Message: 17088

I had run into this problem myself a while back and I have to say that in regards to this problem, the manual poorly documents this and RTFM would not necessarily solve the persons problem:

1) There is no real explanation in the manual as to what extended Menu Mode is. It is documented how to turn it on and off but no details about it. If I didn't know from having read about it here I would think it was critical settings that should not be touched (like the alignment menu). After all, why are they hidden away?

2) On page 54 of the FT-897D manual it explains that pressing the [A] key removes the menu item from the Menu Item loop (which is probably what happened with this user). No further explanation is given nor is it mentioned that going into the extended Menu Mode will bring back those items excluded from the Menu Item loop. In addition it isn't mentioned that pressing [A] again will restore the item to the Menu Item loop.

If I were writing the note section on this, I would have documented it something like:

"3) In step 2 above, press the [A] key momentarily. The "hyphen" in the Menu channel number will change to become a "dot". This now shows that the Menu Item can only be accessed in extended Menu Mode (Menu setting 001 set to ON). To restore the Menu Item, press the [A] key again while in extended Menu Mode. The "dot" will change back to a "hyphen"".

I had a similar experience. Could not pick up much of anything using my Buddipole at home. Went up to my camp in the Sierra Nevada Mountains (4700' elevation) and had most excellent reception on 80m using a 40m buddipole antenna configured as a horizontal dipole at 18' above ground, and other HF bands performed much better too.

This works similarly to the memory channels. "skip"
the menu options that you do not want to see when
extended menu mode is off.

17093. 857 versus 897

Yahoo group: FT897 (2007)
Date: 2007-01-27 18:08:20 UTC
From: Chris Gibson
Topic: 17093 Message: 17093

I am a new member of the group. Until recently I owned an FT-817, but have sold it in order to buy a 100W transceiver. Two natural possibilities are the FT-857D and the FT-897D. Apart from the obvious differences (size and appearance) it's not entirely clear to me what the real advantages of the 897 are over the 857, and whether they justify the higher cost. I would be most grateful for members' views on the relative merits and demerits of these two radios.

Yes that is correct, it is known as a common base 'lossless feedback' amplifer.

Snip>

> happen in many transistorized receivers, btw.

My measurements were done with an external HP step attenuator on a live aerial with external noise.

Readings were taken by using the attenuator to bring the S meter back to the same reading. This eliminates any error in the S meter calibration, which does not seem to be very good. I will check mine and let you know when I get time.

Snip>
> I took a wheelbarrow and brought my Drake TR7 to my shed in the

> readability of ham stations. Later.

I would not rely on comparative S meter readings as an indication of how noisy a receiver is. As you noted above S meters can be very poor and vary a lot. You must go by the singal/noise ratio of a signal when compared between the 2 receivers.

Perhaps it is because people are just looking at meter readings that they are concluding that 897's are noisy, when the truth is that the S meter is a bit generous and non linear!!!!

17095. 897D FAQ Available?

Yahoo group: FT897 (2007)
Date: 2007-01-27 18:51:43 UTC
From: Dan_K9ZF
Topic: 17081 Message: 17095

I'm a relatively new subscriber, but have been lurking long enough to see the same issues repeated several times.

A few years back I bought a new Icom 746 [non pro model]. It was, and still is, a great new rig and I wanted to learn as much about it as possible. So I found a group for the 746 and subscribed. One of the best features of that group was someone [wish I could remember a call, but I have forgotten...] had taken the time to document most of the frequently asked questions, and manual "irregularities" and kept it in the downloads section of the group. It covered everything like best mics, preferred filters to add, and a few known problems with the rig. Most of the info, as you can guess, came from the list members comments. After a few years, this got to be a pretty big document!

Has anyone considered putting together a FAQ for the 897D? As much as I love the rig, the manual certainly leave a lot to be desired. To put it politely...

Wish I had the time to work on it, but it would be a bigger task than I would wish to commit to.

73
Dan

P.S. The old 746 and a couple of transverters was my primary Rover rig for the last few years. The 897D is replacing that setup. The idea was to "downsize," and simplify my Rover setup. The 746 is now my dedicated home station, and the 897D is my mobile rig. I am primarily a VHF/UHF weak signal enthusist, but the 897D will also let me experiment with HF mobile:-)

17096. AF Gain

Yahoo group: FT897 (2007)
Date: 2007-01-27 19:14:12 UTC
From: Terry
Topic: 17096 Message: 17096

Hi.
I wonder what position other users need to have their AF gain control
set at for comfortable listening !! I know it will vary between users !!.

I need to have my control set at around 11 oclock for my own comfortable
listening,this seems a little on the high side when compared with other
radios I have.

Thanks and 73s.

Terry.

Chris,
Unless you intend to operate /P on battery power there is no real gain in paying the extra for the 897.
Remember that the battery (ies) are extras. When I bought mine they were 100 quid a go and the charger was another 100 quid!!!!!!!!

You can always power the 857 from a gel cell should you want to operate away from mains electrickery

Having used both rigs, I think that the 857 is actually an easier rig to use. It's layout is far better, though it feels a little odd at first.
Internally the rigs are basically identical.
My mate bought his 857 about 6 months after I bought my 897... I instantly noticed how much nicer it was to operate.

If you want to sit in the shack in front of a big multibander, then it's the 897, if you don't really care about the size of rig then get the 857.

As much as I hated my 897, I'd buy an 857 for the motorhome or for QRO 6M work... To me anything above 10 watts is QRO :)

About the same here Terry with the internal speaker. With an external RELM mobile speaker 10 o'clock sounds nice. I use the same external speaker, which isn't amplified, for mobile operating in a noisy van and have plenty of volume at about 12 o'clock.

17100. Re: [FT897] AF Gain

Yahoo group: FT897 (2007)
Date: 2007-01-28 01:29:28 UTC
From: Bruce Wilson
Topic: 17096 Message: 17100

Depends what speaker I use. The internal speaker gets a bit harsh when loud, so I run mine about the same level. Thing is, I rarely use the internal speaker. in the field I use headphones that isolate very well (keeps wind and the sound of other operators minimized), or in the shack a small hifi speaker.

I've found that much more critical is the RF gain. I used to run wide open until I discovered that by lowering the RF gain I could minimize the noise without much harm to the signal (discovered it listening to an old Hallicrafters tube receiver). Now I turn AF and RF gains at the same time, then tweak for intelligibility.

Bob.
No need to buy any mic. Just download a free DTMF software
(like "DTMF Dial" is about 600kb or so) and use your PC speakers to
get any DTMF tone. Simple and cost-free. You can use your Skype DTMF
tones as well. ;-)
But if you are away from PCs you can buy (ebay for about 9 USD) a
pocket tone dialer or a DTMF keychain.
Keep your money to buy a nice and expensive mic insteed.

Yahoo group: FT897 (2007)
Date: 2007-01-28 02:17:01 UTC
From: bobmayerau
Topic: 17086 Message: 17102

Dan,

As far as I can tell, after playing with my 897D for 3 years and 857D for 1.5 years , these radios do not have anti-vox. The only solution I have found is always use a headset or close talking microphone, speak loud and reduce the vox gain (menue 88)to 10.

Not very elegant, but my old Icom didn't have any vox at all.

I own a 857 but lurk also in this group.
- Electronics are the same as the 897
- The front panel is a bit more clogged on the 857
- The 857 is cheaper than a 897
- The 897 can be fitted with power supply or batteries
- The 897 has a bigger display
- The 857 fits nice in your car
- The 857 front is detachable and can be remotely mounted.

I use the 857 in my shack and I have ftbasicmmo to program the device
and Ham Radio Deluxe to control and view the tranceiver data.

I took the 857 because I like compact devices, it was cheaper and I
am able to mount it in my car during holidays.
I also have the optional MH-59 Remote control mike
It has handy keypad to enter frequencies and have a few extra handy
controls available.

If you use the device only in your shack without PC or you want
batteries or PSU build in. Take the 879

I like both..

hi john

i have just done the exercise you mention above and have the following
information you may find useful

i have tried a 100mmx100mm cleartone ext speaker with my ft897d and it
is a communication speaker made by cleartone and my findings are as below

cleartone speaker make the ssb sound really sharp and on a medium
volume can make ssb sound almost hard and you will end up turning the
volume back as the sound is uncomfortable like the effect to your
hearing when a high pitch sound is made you cover you ears to avoid
the discomfort.info here
http://cgi.ebay.co.uk/NEW-cleartone-radio-pmr-taxi-cb-ham-extension-speaker_W0QQitemZ13007
2966708QQihZ003QQcategoryZ48709QQrdZ1QQcmdZViewItem

i also tied a 50mmx100mm communication speaker which is standard
supply like this one here
http://cgi.ebay.co.uk/ICOM-Original-SP22-Mobile-External-Speaker_W0QQitemZ220073621040QQih
Z012QQcategoryZ48709QQrdZ1QQcmdZViewItem
this gave a very good result with out bringing in all the crackle with
the ssb signal

dont bother with the cheap cb ones they are rubbish.

there are a lot of larger speakers around with lots of functions and
cost in the hundreds of pounds but to be honest the guy who i got mine
of said you wont see much improvement for a extra £200

regards

Dave,

I really like my little 897 and I am looking forward to taking it on a
DXpedition soon.

However, ANY speaker is better than the one built into the radio.
I just use a small Radio Shack OPTIMUS speaker and it even sounds better!

73,
John

hi john

i have just done the exercise you mention above and have the following
information you may find useful

i have tried a 100mmx100mm cleartone ext speaker with my ft897d and it
is a communication speaker made by cleartone and my findings are as below

cleartone speaker make the ssb sound really sharp and on a medium
volume can make ssb sound almost hard and you will end up turning the
volume back as the sound is uncomfortable like the effect to your
hearing when a high pitch sound is made you cover you ears to avoid
the discomfort.info here
http://cgi.ebay.co.uk/NEW-cleartone-radio-pmr-taxi-cb-ham-extension-speaker_W0QQitemZ13007
2966708QQihZ003QQcategoryZ48709QQrdZ1QQcmdZViewItem

i also tied a 50mmx100mm communication speaker which is standard
supply like this one here
http://cgi.ebay.co.uk/ICOM-Original-SP22-Mobile-External-Speaker_W0QQitemZ220073621040QQih
Z012QQcategoryZ48709QQrdZ1QQcmdZViewItem
this gave a very good result with out bringing in all the crackle with
the ssb signal

dont bother with the cheap cb ones they are rubbish.

In addition the changes specific to the 'D' designation, Yaesu appears to make other changes/tweaks over time. In general, newer rigs may have minor changes/fixes that older ones don't.

17108. Virtual Legacy Radio, DX-Cluster Watch client

Yahoo group: FT897 (2007)
Date: 2007-01-28 09:45:08 UTC
From: ok1fig
Topic: 17108 Message: 17108

Hello all,

I added a first client to the VLR, it is the DX-Cluster Watch. It automatically reloads a WEB page with the dx-cluster information, parses spot lines from it and keeps a consolidated list of them, and inserts the spots into the scale of VLR as frequency markers. Therefore, you can tune your TCVR to any new spot with a simple mouse click.

More info and download at:

My 2 cents: I've tried a bunch of external speakers here in the shack, trying to find one that sounded really good on the 897D, and found that Yaesu's SP-8 sounded best to my warped ears. Your mileage may vary.

I've just done a quick calibration on my S meter on LBS 80m.

The Results show why meter readings should not be relied upon, and
explains sudden drops in indicated values.

The steps between readings are as follows:

S1 -2 1dB
S2-3 1dB
S3-4 0.5dB
S4-5 1dB
S5-6 2dB
S6-7 6dB
S7-8 8dB
S8-9 7dB
s9 -+10 16dB
+10-+20 20dB

I think this explains sudden drops, and shows that the S meter is about
as nuch good as a chocolate tea pot.

Have you looked at the LDG external meter?

It plugs into that mysterious connector on the
bottom front of the 897D. I have seen them
for $40. used.

It seems pretty sensitive and accurate to me,
though I don't have the facilities to test that.

Excellent job, Jeff!!!

It completely explains the drop of the noise (on 80m now:) from S9 to S6 and (on 20m now:) from S8 to Zero.
Guess I just have to get used to this noisy box. [S6 on 80m without preamplifier and with 10 dB ATT!]
And now my partner: She keeps asking me why I bought a new VHF-set because I already had one; She also would like to know why I am suddenly interested in FM. Generally I dislike the chatting on 2m FM and she knows that pretty well . . . .

(And to doc, KD4E: I exclusively use the LDG external FT-meter in my reports on S-meter readings. And it indicates pretty much the same as the FT897D display.)

Thanks, Jeff and 73,
Ad EA/PA0VDP

17113. Re: FC-30 behavior question

Yahoo group: FT897 (2007)
Date: 2007-01-28 17:02:53 UTC
From: Andy Digby
Topic: 17075 Message: 17113

I purchased my FC-30 with the FT-897 rig and my immediate first impression was that it only tunes unbalanced coax cable outputs. I tend to use balanced open wire feeder with my antennas mostly.

Secondly, used with a G5RV test antenna (and 50 ohm coax feed to the balun at the bottom of the ladder section) that I know and have used extensively all over the world, the FC-30 made a major meal out of tuning it on most of the bands. Neither of my 3 ATU's had any problems with the G5RV at all.

I quietly got rid of the FC-30 and still tune my antennas manually with my trusted ATUs !

From: Gene Horr
Topic: 17093 Message: 17116

The electronics are the same. You get more knobs and buttons on the 897 (a material factor for me as I think that the 897 is skimpy enough as it is) and the all-in-one package whether running off mains or battery. Someone has mentioned that the 897 has a better cooling arrangement but I do not know whether this is true.

Since the US and power issues are personal preferences there isn't a whole lot of help that people can give for this choice. You have to decide whether those two items are worth the extra money for your particular use.

I am a new member of the group. Until recently I owned an FT-817, but have sold it in order to buy a 100W transceiver. Two natural possibilities are the FT-857D and the FT-897D. Apart from the obvious differences (size and appearance) it's not entirely clear to me what the real advantages of the 897 are over the 857, and whether they justify the higher cost. I would be most grateful for members' views on the relative merits and demerits of these two radios.

From: Gene Horr
Topic: 17096 Message: 17117

I assume you are asking about SSB or AM listening. When mobile with an external speaker I set the audio gain just under maximum and adjust the volume using RF gain. When I have the spare attention I will fiddle with both settings as different bands/conditions appear to require different combinations for the best reception.

Hi.
I wonder what position other users need to have their AF gain control set at for comfortable listening !! I know it will vary between users !!.

I need to have my control set at around 11 oclock for my own comfortable listening,this seems a little on the high side when compared with other radios I have.

Thanks and 73s.

Terry.

Hi.
Many thanks for all the replies to my audio gain control question.

Now if I may I have just one further general question to ask re my 897 here goes - when in FM mode and no signal present turning my squelch control to just the 9 oclock position closes the squelch - is this normal as most other radios I have usually close the squelch when rotated to the 12 oclock position.

Many Thanks and 73s.

Terry.

A great sounding inexpensive external speaker is the GE Master II mobile speaker used with their two-way radios. The frequency response is taylored for the communication speech band and it has very good sensitivity so you do not have to turn up the volume control very far.

Chris

I had the same question. I for one do not plan to go mobile. If I did I would certainly consider the 857 as the way to go.

a consideration that I did not see mentioned is that the 897 comes with TCXO. If memory serves, if you were to add the tcxo to the 857 the price would be close to the same.

I like a bigger box myslef and even find the 897 a bit on the smallish side, but have become accustomed to it. At Dayton with both rigs side by side, The 897 just seemed more like what I had in mind. I think if you look at the guts, they are just about identical.

I'm assuming you are using the data interface on the back of the radio.
Check Menu #37 (Dig Gain). I set mine at 50 and use the computer volume
control (Wave and master Volume Control) to adjust drive power.

I have noticed this I live in Mountain View close to Moffet field and at times 20 meters is s9 noise and sometimes 70cm doesn't work real well. What's strange is I couldn't imagine our government doing anything that would interfere with radio communications. Well except for nuclear bombs, HARP, Radar, Sub communications, etc.

Where do you live? Since you do not give/have? a ham callsign, I cannot look you up, but from your report it is very likely that your radio is getting overloaded by a strong LOCAL signal source, such as a radio or TV transmitter. That would account for the attenuator having the effect it does. Tell us more about your LOCATION, and I will attempt to do more research.--73, KC3VO-Bob Curry (Adelphi, Maryland-USA)

From: Chris Gibson
Topic: 17093 Message: 17130

I am a new member of the group. Until recently I owned an FT-817, but have sold it in order to buy a 100W transceiver. Two natural possibilities are the FT-857D and the FT-897D. Apart from the obvious differences (size and appearance) it's not entirely clear to me what the real advantages of the 897 are over the 857, and whether they justify the higher cost. I would be most grateful for members' views on the relative merits and demerits of these two radios.

Hi Chris,

For me to decide for 897 was the possibility to have the embedded
230V PS. This makes the rig really compact and mobile. No extra
boxes, no extra cables, etc.

All what i can say is, The unit is good to me and for the last
three years i have no problems at all. I know at the level that
this unit can compete. I am not asking for do something that it is
not made for. If you can understand that, you are going to see it
like a good radio. In contest i just get there to have fun but i am
not expecting have a big score beside it does a good job. If you
clear on that you are going to love it. I am runing here a three

elements yagi from hy-gain about 30 feet above the ground. The antenna is resonance for the three band that is made for 20/15/10M, with an SWR about 1.1 or 1.2 at the center of the voice portion depending the band. I put a ATU in line to match it down 1.0 and for the CW portion of the band. I have the FP-30 PS and no problems at all and that PS in particular made it a solid unit to travel and tranfer it outside or fielday. That all what i can say. I am clear about how much i spent on it and what performance i was able to get for the money i paid and this is a happy owner of the FT-897D.

Dear Lee~~

Well, there's several 897 Menus that must be set (like #37-- no more than 50, #38-PSK31-U) but most important is:

1) Be sure RASCAL plugged into data; not cat; port
2) FT-897 to be set to mode 'DIG' not ssb, for HF [PKT for VHF FM]

Good luck,
Bill W1WAB

Odds are that it is the problem. I had endless problems with that cable. All you need to work the digital modes with an FT897 is a cable that has the DIN connectors on the rig end for the audio in and out, and the stereo connectors at the other end for connection at the sound card. Pretty simple. You can key the rig with the Digital Vox or you can use CAT control with a serial cable obtainable from Yaesu.

From: von_landstuhl
Topic: 17138 Message: 17138

Hi all,

I just bought an FT-897D and interanl power supply this morning, so I thought I'd introduce myself.

I've had my Technician license about a year and I'm studying for my General. I got into electronics via the military (MOS 26Y - SatCom), so I started my collecting green radios. So far I have:

PRC-25 -- 30-76 Mhz, Wideband FM, 4 Watts, 12 VDC
PRC-77 -- 30-76 Mhz, Wideband FM, 4 Watts, 12 VDC
AM-4477 -- Israeli-made 30 W amp for the PRC-25/77
RT-524 -- 30-76 Mhz, Wideband FM, 25 Watts, 24 VDC
PRC-47 -- 2-12 MHz, USB, 100 Watts, 24 VDC

Some of my stuff is seen here:
http://i4.photobucket.com/albums/y126/von_landstuhl/shack.jpg

My wife is looking forward to having a practical radio in the house.

It is an ITU region 2 only band (like 902-928MHz). However it is curious why it is not available in the U.S. version of the FT-897 (D). The U.S. version of the VX-7R has it, albeit at lower power that the other bands.

The only material negative is that when changing modes you have to go
through too many menu settings. This is offset by the three custom key
settings to a large degree but is still a factor especially if using it
mobile.

Yep...Yaesu's are menu hogs...Its a great rig but not not as nice as my TS570 for a desk radio...It should be compared to a hard working military radio...not a mobile or a base rig...Its right in between the two...

Bryan, et. al.

I use the SGC 239 SmarTuner between the shack and the antenna.
It is mounted inside a TupperWare box mounted on the side of the house.
The box is spray painted the same color as the house so it kinda disappears,
and the paint helps protect the box's plastic from UV degradation.

It center feeds a 300' long dipole (EDZ) using 450 ohm ladder line to the
antenna, and RG-59 back to the shack. Works great on 1.8 - 54 MHz.

I know, I know, it is only rated 200W and 1.8 - 30 MHz, but what can I
say?! It also works fine on 6M too, at least with my loooong antenna (HI).

73,
John - K8OCL

BOB,
THE LDG TUNER FOR THE FT-897 IS THE BEST. I HAVE HAD THE ORIGINAL YAESU TUNER THAT CONNECTS TO THE SIDE, JUST LIKE THE LDG. THE LDG IS THE BEST.

I bought an old Heath SB600 speaker on E-Bay and it sounds as good as anything including several Kenwood speakers and Motorolla commercial units. Huge improvement over the internal speaker.

If your FT-897 S meter shows any signal at all with no antenna it is either broke or the RF gain control isn't properly set.

I'll tell you what, I have used several external speakers. What I have found works best is the cheap surround systems you can get at different retailers for about $50. You get excellent control over the sound, and the price is not astronomical. If you don't like it on your rig, you can hook it to your TV! You can check out how mine is set up here:

http://www.w8ax.com/equip3.jpg

You'll notice the control for the system just above the monitor and the speakers in the corners and behind the monitor. Surround speakers are behind me - but rarely used. Also, there is a sub under the desk. Superior sound for picking out weak signals. The EQ lets me take out a lot of noise. Pretty sweet for $50. I just plug it in from the headphones out with an RCA adapter.

17154. FT-897D Versus TS-2000

Yahoo group: FT897 (2007)
Date: 2007-01-30 06:37:43 UTC
From: mikemills101
Topic: 17154 Message: 17154

I am considering the purchase of my first non-HT radio. I want one of the one-rig wonders; all bands, all modes, all in one box. What do you think about either of these as my choice for a first radio? Which would you get? (a silly question for this user group).

I do not really want to spend the $1.5k to get a TS-2000, hence, the 897D is still on my short list.

I like lots of buttons and knobs (no I'm not kidding), so the TS-2000 is still on my short list..

QUESTIONS - Is the TS-2000 worth the extra money or should I just get the 897D? What do I get for that money?

I'm almost a total newbie to ham radio. I have a Tech license and have passed the General exam (CSCE to prove it) but haven't gotten my General license yet. I am studying morse code, even though I no longer need it for my General license.

I had to make the same choice as you. I actually went to Ham Radio Outlet in Atlanta to see the TS-2000 but ended really looking at and eventually purchasing the FT-897D because of it's price and $ per feature! This rig has everything! The TS-2000 is in a different class - kind of like a Mustang vs Corvette thing. Both are excellent and fast but one is considered classier and is slightly faster on top end. Someone like me will never notice the difference.

Go with a FT-897D, MFJ-969 tuner, and a multi-band antenna. I used a horizontal sky loop that is 550 feet long. Works gang busters!

I passed my code test on 1/13/07 and I'm very happy that I did. CW is very fun!!

Bob- first the disclaimer - I have no connection to LDG other than I use and like their products. That said, I really love my LDG Z-11 Pro with my FT-897d. Some of the positives:

1. Can run a long time (year +) on 8 AA's mounted inside the case! Great for portable/mobile use.

2. Selectable modes: Autotune, semiauto, manual touch-up, and Hi Z/Low Z antennas

3. Selectable SWR threshold for autotune

4. LED displays SWR when transmitting.

4. Unique memory setup that in conjunction with the LDG DTS-4 coax switch lets you run 4 seperate HF antennas with autotune for each one. See my post at http://groups.yahoo.com/group/LDG-auto-tuners/message/2202 <http://groups.yahoo.com/group/LDG-auto-tuners/message/2202>

5. Will tune all types - verticals, dipoles, beams, and long wires or ladder fed(with a balun).

6. Support from Dwayne Kincaid at LDG that is unbeatable!

My only negative - sounds like a blender with ice cubes while it does the initial tune! But I just think "margaritas!" and the noise is done before I know it!

You can download the manual from http://www.ldgelectronics.com/c/261/product-manuals <http://www.ldgelectronics.com/c/261/product-manuals> Z-11 Pro is my vote.

From: thb201
Topic: 17143 Message: 17159

I also have an MAC-200 tuner, and not to contradict Bryan as he may have a different experience with his, I am somewhat less than impressed with it. First I tried using the balanced output on an antenna with open wire feeder (end fed Zepp). The tuner didn't like this. It wouldn't hold a tune and the SWR seemed to keep wandering around. Turns out the internal balun was overheating. This tuner is rated for 200W and I was only putting about 20W through the tuner and the balun still overheated. I've heard of others having similar problems.

Then the MAC-200 does not seem to like end fed long wire antennas, even though SGC claims it will tune this type of antenna and there is a dedicated terminal on the back for long wires. End feds can have high impedances at the feed point (several thousand ohms). SGC claims the MAC-200 will match up to 5000 ohms with a long wire. The tuner would hunt and not be able to find a match, or if it did then it would lose the match. Also the memory would not retain the settings. Apparently the high RF voltages present at the tuner output were upsetting the tuner's microprocessor. High RF voltages are "normal" with this type of antenna so if the tuner can't handle it then it is misleading to say so.

I then tried it on several "normal" antennas (tuned dipoles) and even there this tuner had difficulty remembering settings. Even doing a "reset" didn't help.

The SWR and Power meters on this tuner are all but useless. SGC says they only give a rough indication, but when the power meter indicates 150W when I'm only putting out 20 or 30 watts, then that's a bit too much of a rough indication for my liking.

I contacted SGC but they were not too helpful. They said they were not aware of any of these problems, and that was that.

This could have been a very nice tuner but for me it turned out to be a bit of a dud. I don't think it's just my particular tuner as I've heard of others who have complained of the same problems.

I'd stay away from this one. I tried my friend's LDG AT-100Pro and it is a way better tuner. Even my old Dentron manual tuner is way better than the MAC-200. That's my 2 cents worth. Sorry for the rant but maybe this info well help prevent someone else from wasting their money. Go for an LDG tuner.

It really will depend on how you are going to operate and what type of antenna you are going to use. I use my 897D for a lot of portable operation (camping) with an outbacker, loop and dipole. I like the LDG Z-100 because it is physically small and can be operated for a long time on two 9V batteries wired in series. It is cheap and reliable for an automatic tuner. The tuner that attaches to the radio would have been my second choice but I didn't want to add to the size of the 897.

Mike
I've operated both rigs and I can say the TS 2000 has a lot more "class" than the Ft-897 and I like the fact you can have ful monitor and transmit capabilities on 2M/440 while scanning the HF bands. The FT 897 won't do that. But at twice the price for the TS, they aren't even in the same class of radio. It depends on what operating conditions you want to cover.

I have tried both rigs.If you look closer at the ARRL receiver test performances for both rigs,they are very close (be sure to look at the updated 897D specs).On the desk,the Kenwood sound better. However,my 897D fitted with the Collins SSB filter and a good external speaker play really well.Here in Canada,the 897D was half the price of the TS2000 so the choice was easy.The Kenwood have satellite capability.
Pros for the 897:
Solid military-look construction vs the cheap plastic look of TS-2000
Can be customized with many accessories (PSU,batteries,etc)
Good AM audio for SW listening

Cons for the 897 :
Need an external speaker and menus ajustments to sound good
Direct frequency entry need an optional mic (MH-59)
Extensive use of menus

My opinion : Get a 897 and spend the rest of the money on good antennas.

Good luck in your choice.

From: David Amos
Topic: 17166 Message: 17166

I am going to use the FT-897D for base operation. I have very limited space. I would like to be able to work 160-6 meters with one antenna located on the front roof line of the house... Once the antenna is up I will not be able to mess with it since I have very limited mobility.

I have looked at the High Sierra antennas so comments on them would be nice too... For another antenna I was thinking about a 3 band antenna for 6, 2, and 70cm.... This could also be located on the front of the house.

Give me some ideas.. I don't want to throw good money after BAD ! ! I am retired an on a very fixed income. SO I have to plan ahead for every move.

I'm not sure about how much space you have to work with, but I just installed a 550-Ft horizontal wire loop that I'm working 160 through 6 on. It is made from 14 gage shielded wire and is hung in the trees around my property. It works great and it is practically invisible which is a plus since my neighbors actually would complain if they knew about it. Ha! Ha! Ha!

I have also seen many designs for attic antenna that seem to work well. I also saw one ham who took a wire and basically outlined the exterior of his home with it giving him enough length to work 80 M.

I would also check out the forums at www.eham.net for more great ideas.

I'm not sure about how much space you have to work with, but I just
installed a 550-Ft horizontal wire loop that I'm working 160 through 6
on. It is made from 14 gage shielded wire and is hung in the trees
around my property. It works great and it is practically invisible
which is a plus since my neighbors actually would complain if they knew
about it. Ha! Ha! Ha!

I have also seen many designs for attic antenna that seem to work well.
I also saw one ham who took a wire and basically outlined the exterior
of his home with it giving him enough length to work 80 M.

I would also check out the forums at www.eham.net for more great ideas.

17172. Re: Antenna help

Yahoo group: FT897 (2007)
Date: 2007-01-31 14:01:23 UTC
From: mrmsudawgs
Topic: 17166 Message: 17172

The loop is between 35 and 50 feet off the ground depending on the height of the tree. My dad is using a loop that is about 1200 feet long and about 25 feet off the ground. They are easy to install but get help if you can. Also, install it before the leaves come back in the spring because it will be easier to see what you are doing.

Have a look at some of my photos:
http://picasaweb.google.com/mrmsudawgs

I also recommend reading all you can about loops before you start building one. The ARRL Antenna Book is a great, great source and is what I used. I also visited many sites on the web. Here are just a few:

http://www.cebik.com/wire/horloop.html
http://www.dxzone.com/cgi-bin/dir/jump2.cgi?ID=7489
http://www.dxzone.com/catalog/Antennas/Loop/

You can Google "horizontal loop antenna" and come up with more hits.

In a nut shell, you will need;

(1) At least 1 full wave length of wire at 160 M (which is about 530 feet). You can add a lot more wire. Use the maximum length you can get.

(2) You will need a roller inductor tuner that can tune 160 - 6 M. I use a MFJ-969. Forget about "automatic" tuners. They do not have the impedance range needed for long wire, mult-band operation.

(3) Feed the antenna with 450 Ohm window ladder line. This is unshielded so beware of RF in the shack. I ran two parallel coax cables from my shack to outside the house. The center conductors of the coax are connected to the ladder lines. The coax shields are connected together and grounded back at the station. This provides shielding within the shack. This idea came from the ARRL Antenna Book.

(4) A method of string up lines into the trees along with saws and shears to rid yourself of those pesky limbs that are snagging your wire.

(5) Use shielded wire. There is a lot of discussion regarding shielded versus bare copper - but if the wire is going to touch a tree then it needs to be shielded. Otherwise, the tree will ground your antenna. I ordered my wire from Davis RF
http://www.davisrf.com/ham1/flexweve.htm I used FW14P wire. I highly recommend it.

Whew! I hope I did not overload you. This is still fresh on my mind since I just installed it two weeks ago. Read, read, read all you can before you install. Get the ARRL Antenna book. Review the web sites and see the work that was done by other hams.

You will really enjoy the antenna once it is installed.

Not too bad. Some of the fun features are down
a layer or two in the menu but the common ones
are right there.

I chose the 897D over the 857D because more of
the controls are right there on the face and
more obvious.

My other HF rigs are a SBE SB-33 and a WRL SB-175.

Questions:

Many rigs remove the rf pre-amp on 80 & 160 by
default.

Cannot the 857/897 be programmed to do so as well?

Perhaps it is just a matter of tweaking the default
setup?

17176. LDG AT-897 Bypass

Yahoo group: FT897 (2007)
Date: 2007-01-30 18:06:06 UTC
From: David Zahler
Topic: 17176 Message: 17176

I have been using an AT-897 tuner on my FT-897 for about tow months and couldn't be happier with the performance, it has been able to tune just about any reasonable antenna I've connected it to.

I am now using a Buddipole for portable operations and my problem lies in the bypass function. I know that a momentary push of the "Tune" button will bypass the tuner, but I have no confirmation that it has occurred. Optimally I would like to have an LED on the front panel, that would indicate the condition. Has anyone out there found a point in the ciruit that I could tap to get the status?

I have written LDG and they responded quickly but, were basically no help. LDG's answer was that it's all software driven and no point could be tapped for status. Unfortunately not the answer I'm looking for. I have proposed that they modify the software to distintively strobe the tune indicator after the momentary push for visual confimation. This would be a change, only in the firmware and wouldn't require a mechanical change.

I think anyone out there that is using this tuner, or considering its purchase, should email LDG (ldg@...
<mailto:ldg@...>) and ask for this feature.

Thanks for the clarification. I had read elsewhere
that for some reason the LDG meter did a better
job than did the internal display.

Yeah, but my slowly aging eyes can read the LDG
meter more easily and there is something about
that bouncing/moving needle display that cannot
be replaced by a digital readout!

The outboard LDG S-Meter/Power Meter is a really
valuable addition to the 897D.

I was just tweaking my antenna tuner to the noise -
it is that sensitive.

I believe that you will get a better sense of what
is happening with the LDG meter than with the internal
meter.

The LDG meter is much easier to read,
but it is no more nor no less accurate
than the 897's built-in meter.

Plus, you can put the LDG anywhere
you want it at the time, and it can be
viewed from almost any angle. Very nice.

Have you looked at the LDG external meter?

It plugs into that mysterious connector on the
bottom front of the 897D. I have seen them
for $40. used.

It seems pretty sensitive and accurate to me,
though I don't have the facilities to test that.

The "D" stands for DSP (digital signal processing)
also made standard.

Terrific feature that makes listening to noisy
bands, e.g. 160M right now as I am typing, much
easier on the ears!

17185. 300-Hz CW Filter: Collins Mechanical Filter

Yahoo group: FT897 (2007)
Date: 2007-01-31 15:38:06 UTC
From: w4wb
Topic: 17185 Message: 17185

Recently, I have received a number of requests for the 300-Hz Collins Mechanical Filter for CW and PSK use. I am please to announce that you can now acquire the 300-Hz Collins filter from W4RT Electronics as a plug-in filter ($109). The filter board is coded so that the radio knows its bandwidth, and the same filter can be used in the FT-817, FT-857 and FT-897.

See http://www.w4wb.com/FT-897-Accessories/filters-CW-SSB-only.htm for more information.

Doc,

If you were referring to the differences between the FT-857/FT-857D models then yes, your declaration of the "D" meaning digital signal processing (DSP) would be true. However, for the FT-897 series radios DSP has always been a standard feature.

Having said that, the enhancements of the FT-897D over the non-D model are the aforementioned addition of the TCXO as standard as well as the addition of the 60-meter band. There are also rumors of the noise floor level being improved on the FT-897D but I personally have not seen any information to substantiate that claim.

Regards,

Mark (NM7L)

In the D version it is not possible to do a 'Software Broadbanding' anymore because that function has been write protected in the EEPROM by Yeasu. The only way to widen some bands for the TX is with the 9 solder pads. I read this somewhere; don't know where. Maybe someone can confirm this?

I understand your dilemma. I bought the INRAD filter and put it in when I received the radio from HRO. I wish I had some before/ after reports. I have heard from some folks that say they can't really tell a difference when they install the filters. If I had it to do over, I would run the radio for a while without the filter, if performance was adequate, I'd forget about the filter.

Peter,

I believe there is no way to disable the transmitter function of the FT-897 via the accessable menu. Perhaps through the hidden menu, but you don't want to go there unless absolutely necessary. The only sure way of not using the unit in transmit mode is through sheer will power (abstinence?).

Yes, it is possible to use the rig without microphone or key attached. Just remember, when you finally become a licensed ham & wish to operate the FT-897 that you remember to attach the microphone and/or key before turning the rig on. FT-897s tend to go "squirrelly" when a mic or key is attached when operating.

Best of luck in your studies.

Regards,

Mark (NM7L)

From: thb201
Topic: 17166 Message: 17195

Just a point of terminology here. I think what Mike means when he says "shielded" is actually "insulated" wire. Shielded usually refers to wire that has a metallic or braid shield surrounding the central wire core. For example coax cable is shielded wire.

The Flexweave wire being referred to here is a form of insulated wire. In other words it has a plastic coating on it that covers the metal wire, as opposed to just bare copper wire. The idea here is that the plastic coating will insulate the wire if it touches some other object like a tree. However be very careful that the antenna wire does not come anywhere near power lines. Even if the wire is insulated you're looking at a very dangerous situation if the wire touches any power lines. You risk not only ruining your rig but also electrocuting yourself. Safety first when stringing up an antennas. Good luck.

17197. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2007)
Date: 2007-02-01 17:19:26 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 17197

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

17198. RE: [FT897] Re: Antenna help

Yahoo group: FT897 (2007)

From: John Champa
Topic: 17166 Message: 17198

Mike,

Because of the RF skin effect, I think that outdoor antenna wire
should ALWAYS be insulated with UV resistant insulation.
Copper oxide does not conduct as well as copper.

This is especially true regarding the "classic" antenna wire
for Hams: Copper clad steel wire. If a pin hole develops
in the copper cladding, then the inside steel wire will rust and snap
under load.

73,
John

17200. CW Transmit Switch ?

Yahoo group: FT897 (2007)
Date: 2007-02-02 03:48:21 UTC
From: Guy Gibson
Topic: 17200 Message: 17200

This may be a silly question, but is there a way to manually set the rig for transmit? such as the send switch on the older Kenwoods. Recently I have had to slow down for some of the slower folks and the constant chatter of the relays drives me nuts (not real good for the rig either). If I turn the delay up to stop this, I usually miss some of the other fellows response. Having only had the rig over a week I'm not too familiar with all of its functions. I have a 817 and find most things the same or very similar. Both good rigs!

From: ok1fig
Topic: 16991 Message: 17203

This was the most useful hint I have ever read on this group!
I was a bit hesitant to fiddle with the service menu settings but I tried to lower HF1RXG and HF2RXG. Yes, what a difference!
I wonder why Yeasu sets sensitivity of bands like 80 or 40 mtrs so high. I guess they assume that the rig will be used mainly for mobile. There it does make sense. If you use a proper HF antenna then lowering the sensitivity puts possibilities of [IPO]-[ATT]-Rf.gain back to reality...

Tnx, Petr, OK1FIG

What kind of jack plug are you using John?

The manual specifies it must be stereo. I bought a
couple recently - 3.5mm. Dot paddle to the tip, dash
to the middle ring, ground/return to the outer/sheath.

The mechanical filter has slightly lower frequency bandpass than the ceramic filter so it cuts a little more high frequency noise which is barely noticable. The big difference to me between the mechanical and ceramic filters is when you use IF shift (hold the Clarifier key down for one second). The mechanical filter has much sharper skirts in its frequency response which seems to make the IF shift more effective.

Make sure that you turn the auto keyer function on in the menu set. I can't remember which menu selection does it but you have to turn it on. Otherwise, your iambic paddle acts like a straight key.

Also, make sure that you use a 1/8" mini STEREO jack. Do not use MONO jack or your keyer will not work correctly.

17214. The FT897D MARS MOD - An Observation

Yahoo group: FT897 (2007)
Date: 2007-02-03 01:26:33 UTC
From: Patricia Gibbons
Topic: 17214 Message: 17214

I completed the MARS Modification on my FT-897D yesterday, and performed the microprocessor reset. Everything worked out fine ..

The only pads that should be jumpered for this modification are:

1006, 1007, 1008, and 1009 ...

I wanted to share an observation that may be helpful to others ..

I was using the radio for about three hours, then turned the set off while I watched a movie..

In rearranging things in our library building for the movie, I had laid a book on top of the telegraph key and did not noticed this at the time..

After the movie, I turned the rig back on, and found that I could not change bands, could not change modes, and in all other ways, the radio was operational..

Once I discovered the book on the telegraph key, and removed it, the other functions that were not working were okay after powering the set off and back on ...

It looks like a contact closure of the telegraph key being present when turning on the set caused a lock-up of some functions of the set, but was not of a permanent type of glitch, since all functions were restored when the set was turned off and back on ..

Odds are that it is the problem. I had endless problems with that cable. All you need to work the digital modes with an FT897 is a cable that has the DIN connectors on the rig end for the audio in and out, and the stereo connectors at the other end for connection at the sound card. Pretty simple. You can key the rig with the Digital Vox or you can use CAT control with a serial cable obtainable from Yaesu.

Thanks for all of the input, I found the problem and it seems to be the type of plug going into the transceiver. So, I ordered P/N CP3 from Vibroplex Co, Inc. for $12.95 including shipping. I hooked it up and immediately, my keyer worked according to what it is designed to do.

Have a look at Heil Sound.
Most Heil mice have XLR connections on the rear. You buy the mic and the cable seperately.
Heil sell cables for most rigs.
Just be careful that they are wired the same as the Heil cable also carries the PTT circuit.
I doubt if the cable anything that special. I'm sure with the right bits and a wiring diagram you could knock something up.
Don't forget that the rig end is a standard RJ-45 connection, so leads are easily and cheaply bought, just don't buy a crossover cable.

I use a RigBlaster Plug and Play with mine. I use Ham Radio Deluxe with its imbedded PSK31Deluxe, and a dll which enables MMTTY to work through the HRD connection.

Not really what you asked and is certainly not as capable as the Pro or Plus, but certainly does all that I need or want.

From: ke5elu
Topic: 17225 Message: 17232

First off I am assuming that since you are running a SignalLink that you are set up in Echolink as a -L or -R station.

The 897 does not require any changes to it to hear DTMF commands. When you send DTMF with your HT, look at the very bottom of your Echolink screen and you should see these coming across. If you see tones coming across, make sure they are the correct ones. I have seen cases where my DTMF tones did not come across or were wrong, sometimes this was because of the radios being too close, volume settings or me entering the codes wrong.

The other thing to check and this is most likely the culprit. In Echolink, assuming you are set up in sysop mode, go to tools, then DTMF, and make sure that you have the box checked for Internal DTMF decoder. If this is disabled you will not get any DTMF tones to the computer and they will not show up at the bottom of the echolink page.

By the way, I also run a Signalink with my set up here. Great interface. I run it on a FT-7800 but can just plug in to my 897D anytime I want to use it.

Hope this helps!

17234. Slower AGC mod

Yahoo group: FT897 (2007)
Date: 2007-02-05 01:39:44 UTC
From: Dave Campbell
Topic: 17234 Message: 17234

Does anyone have any experience with the suggested mod of
adding 10 uF across C-1503 (labeled C-105 ?) to slow down the
slow agc on ssb.
I did the mod and it did just the opposite! The slow agc was faster
than the original fast agc and the fast even faster?

My only complaint with this radio has been the harsh, and a little
distorted audio on ssb. I have an early production. Does anyone know
if Yaesu has fixed this with the latest versions.

Thanks, Dave

I, too am looking to hook up a high end mike and/or an equalizer, but have yet to succeed. The Data input on the back will not work on SSB or AM, and any direct connection through the mike input drives the radio nuts.
Yes, the radio is not HIFI, but where is the fun if we cannot experiment?

From: Mark Vaughan
Topic: 17234 Message: 17237

Yes I've done the mod and like it.

The capacitor simple damps the AGC, you add a little more capacitance to damp / slow it further.

If it has gone quicker, I would expect you have accidentally unsoldered the end of the original cap.

The mod on my 857 works well on HF, reduces short noise spikes from desensitizing the radio which before reduced the AGC.

I have also loaded the Squelch circuit. The squelch was OK for bench top use, but mobile background noise has lots of short spikes on it that would always annoyingly open up the squelch. The mod stops this, the only problem it does have is if you use the scan function it needs a stronger signal to break through, so scan will miss some things unless you reduce the squelch setting when you scan, and wind it back up a bit when you stop scanning..

17239. Re: [FT897] FT897 Auto Keyer

Yahoo group: FT897 (2007)
Date: 2007-02-05 16:50:27 UTC
From: Lew Phelps K6LMP
Topic: 17202 Message: 17239

A couple of things to think about. First, and most obviously, is the question of menu settings, which I presume you've set correctly, but will review just in case.

Press the [F] key momentarily and then rotate the MEM/VFO knob until the menu that appears reads: SPOT BK KYR.

Press the KYR to enable the electronic keyer. [Brackets will appear around KYR to show that the electronic keyer is enabled, thusly: [KYR].

You can also press and hold the KYR key for one second and it will bring up Menu Item 30, which allows you to set the speed of the keyer.

I also had a problem when I first tried to connect a home-brew key to the rig. The KEY jack on the back of the rig is recessed. The diameter of the recess is slightly tapered, and tight enough that some "standard" 3.5 mm plugs will not quite fit all the way in. So you might check to be sure that your plug is small enough to fit all the way in, allowing the three elements on the stereo plug to mate correctly with the three elements on the jac.

Good luck.

17240. Re: Slower AGC mod

Yahoo group: FT897 (2007)
Date: 2007-02-05 19:11:23 UTC
From: Jochen - DG2IAQ
Topic: 17234 Message: 17240

Hello Dave.

Sorry to hear. I'm the author of this modification. As paralleling
HAS TO SLOW DOWN the AGC time due to the higher value of the
paralleled capacitors, something must have gone wrong with your mod.

I don't ask if you found the CORRECT cap, cause there WAS a reaction.
But the wrong one, ...hihi.

So my only explanation is that you reversed the parallel cap and the
reversed polarity in parallel with the original cap produced
a "shortage effect" instead of a "lengthening effect" (I hope my
english explanation is OK for that !?)

On the SMD capacitors the RING is the pluspole !! Not the minuspole
as expected from normal size parts.

Maybe this was the fault and you definitely reversed the additionally
cap ?

Best 73,

Jochen Heilemann (DG2IAQ)

17243. FT-897D no VHF transmit

Yahoo group: FT897 (2007)
Date: 2007-02-06 13:25:18 UTC
From: taikajim74
Topic: 17243 Message: 17243

Hi all

I run into a strange problem. My 897 doesn't transmit on VHF (2m), but everywhere else. It is bought on sep 2005. I did this once before, but I noticed burned coil on exciter. PA transistor seems to be ok, since it transmits on UHF and according to schematics it uses same transistor for VHF/UHF. Any ideas?

I'll echo Darren's comment. I use the Heil Pro Headset. The adapter I bought with it will take any mike with a standard headset plug (the full 1/4 inch version). Since my TenTec gear uses that config for it's mikes, I've been able to use any of my mikes on the 897D.

Now if I only had something worthwhile to say in high fidelity...

Is anybody using the Plug & Play who also has an LDG AT-897 tuner? My Plug & Play works fine when connected directly to the radio's CAT port, but does not work when using the AT-897's CAT OUT port. TNX & 73 de Paul, W1PR

Hello Paul. The CAT connectors on the AT-897 are recessed more than the one on the radio, therefore, the plug that you are trying to plug in may require a little "shaving" of the molded rubber of it's case to be able to successfully plug in enough to make connections.

73,
Ken

17247. New album

Yahoo group: FT897 (2007)
Date: 2007-02-07 01:50:38 UTC
From: puntrad@comcast.net
Topic: 17247 Message: 17247

HI.
I just open in the Pictures sector an album under my call sign KG4FSN.
I included there a CAT and Digital interface that may help someone to connect the FT879 to a PC running for example Logger 32.
As a comment I would say that the transformers were from old PC modems and that the D275 may be asked from Dallas as a sample. The NPN transistor could be any one for example the 2N2222.
My desire was to make an interface that using the mike jack allowed me to free the back CAT din 8 for another use. (Menu 020 "CAT/LIN/TUN). So the shown circuit has a RJ45 female to accept the mike and a RJ45 male that plugs into the mike connector of the FT897D.
Finally if you decide to use it don't forget to modify the settings at the menu items 059 "MIC SEL" from NOR to CAT and if it is necessary item 019 "CAT RATE" to match your PC application's serial bit rate.
Hope it is of any utility.
73
Juan - KG4FSN

From: Sergey Sysoev
Topic: 17248 Message: 17248

Guys, I am really sorry for off, maybe anyone know where to obtain FBR22D12-P relay? Is is protection relay, Icom p/n 6330000110.

I've searched Internet but found no sources, somewhere mentioned but min. order amount $250-500. Digikey also has nothing. Thanks a lot!

Check out the Behringer XENYX 502 (UB-502) mixer. There are reviews on www.eham.net . This has an XLR input and an unbalanced output that can be fed into the 897's mic socket after the level is suitably reduced by the mixer's ouput-level control. However, one needs to be careful about RFI getting into the equipment; some people add a 1:1 audio transformer or W2IHY ibox before the input to the rig's mic socket.

17251. New member here

Yahoo group: FT897 (2007)
Date: 2007-02-05 23:03:51 UTC
From: Ross
Topic: 17251 Message: 17251

I just wanted to check in and say hello. I just passed my technician test last Saturday and I'm working on my General. I may go for extra. I'd like to become an examiner because my net includes an area covering a large county and about 3000 possible members which means constant testing. I just learned that our members in our back county that live in valleys in our mountainous area are going to "Near VerticalIncident Skywave". I need to communicate with those people because they live along the dangerous border area and in a high fire hazard zone. Not the least of their problems is a very dangerous, twisting, narrow road that has claimed many accidents, including fatalities.

To shorten this message a bit I'll cut to the chase. While reading up on Near Vertical Incident Skywave (NVIS) I came across a site for the 897-D. I'm a beginner so I didn't know if this would be a good radio for NVIS or not. I also need 2m and 6m, which we use a lot.

If anyone that has experience with any of this would care to share information with me I would appreciate it very much.

Thank you in advance,
Ross

Jani,

As I recall there is a solid-state relay that selects either the 2m & 70cm circuitry to utilize the common PA. This relay did in fact fail on my FT-897 shortly after purchasing it in July 2004 and was repaired under warranty with Yaesu USA. I don't have a schematic handy at this time but if you do just look for a switching device upstream of the VHF/UHF PA circuit.

Hope that helps.

Mark (NM7L)

Ross:
Yep, it's actually a pretty good radio for NVIS work. Since it does 100W on external DC, it's as good as most radios for base NVIS operations, assuming you're happy with the DSP and suppression of whatever noise you may have.
On battery power at 20W it's pretty much in that optimal power level for field NVIS operations. In most cases 20W should be sufficient and the radio can operate for some time at that level on 2 internal batteries with a typical transmit duty-cycle. If you need more, a small (i.e. 20 AH) external battery can run it at 100W for a bit or simply run a power cable to a car battery for extended operations. Also having VHF/UHF makes this an overall good radio for field operations, unless you need very light-weight for backpacking.
I mention the field operations since that's a typical application of NVIS, but there's nothing magical about a radio for NVIS other than it being applicable to the way you're going to use it.
The magic of NVIS is really in the antenna and frequency selection. There is an "NVIS" Yahoo Group that's pretty active and on which you'll find lots of expertise and experience, if you're interested in more NVIS discussion.

This is IMO a great 2nd radio after your hand held radio. This radio can do just about everything good, nothing well but what do you expect from an inexpensive small all band all mode radio.

But before spending the 800 dollars get the handheld so you can make sure you like the hobby. The handheld will always come in handy.

17258. Noise on 6 meter tx

Yahoo group: FT897 (2007)
Date: 2007-02-08 02:29:43 UTC
From: watco_2
Topic: 17258 Message: 17258

I spent all weekend tracking down a noise on 6 meter tx. A friend of mine listened and as I disconected each piece of eqpt. I had, the noise never went away. One persone told me the noise was S7 on his rig across town.
This occured when I first bought the rig in Nov. 2006 then quit so I thought it was some kind of glitch in power supply. Then it came back the other day.
Monday came around...called Yaesu talked to tech. Jerry. I told him of my problem, he thought for a minute and asked if the noise was on ssb, which it is. He then told me that they had come out with a fix for this last week.
Mine is on the way to the west coast now. Buy the way my ft-897d has a serial no. starting with a 6 so this makes a fresh batch with the problem I heard about before.
It will be about 30 days. I Will report on the outcome then.

17265. Re: [FT897] West Mtg. Rig.

Yahoo group: FT897 (2007)
Date: 2007-02-09 03:59:49 UTC
From: Joe B
Topic: 17226 Message: 17265

Bill, The RigBlaster Pro and RigBlaster Plug n Play are very similar, but neither is the best choice for the FT-897D.

The Rigblasters both work with the same software (anything compatible with your sound card), but the Pro model has speech processing for transmit audio, and includes isolation on the receive audio. The pro also includes an interface for rig control, which is the equivalent of using a serial port and cable to the CAT port.

Both of the Rigblasters were designed to work on any radio. That's a feature you'll want if you are going to switch radios. However in my opinion there are too many wires between the radio, rigblaster and PC.

You may want to consider interfaces that are more convenient with the FT-897D. The RigBlaster Plug n Play is tailored to radios like the FT-897D that have a DATA port, and is the one recommended by WMR tech support. One cable between the radio DATA port and the sound card interface will give you PTT, receive audio, transmit audio, data and mic ground. However you must still hook up your sound card to the interface.

The choice that I am going with is the Tigertronics SignalLink USB. One (data port) cable between the radio and the interface. One USB connection between the SignalLink and the PC. No external power required. That's because the SL-USB has a sound card built in, and gets it's power from the USB port. That will eliminate issues of matching input/output audio levels between the interface and the sound card, and it will help to isolate the PC from the radio.

The only disadvantage to the SL-USB and the RigBlaster PnP is that there is no direct "true" keying of the radio for CW and PSK. As an alternative, you will use audio PSK (APSK which is specifically mentioned in the FT-897D manual) and audio CW too. For a purist, that could be a negative. But then those might be the same guys that prefer to QSO in CW by hand and ear.

Take a close look at the Rigblaster PnP as well as the
SL-USB (not the SL+). For my money, and the old 300
MHz tiny laptop that I am using, I prefer the SL-USB.

Paul,
The RigBlaster PnP uses the DATA port, not the CAT
port. I don't believe that the AT-897 has a DATA
port.

17268. Re: [FT897] West Mtg. Rig.

Yahoo group: FT897 (2007)
Date: 2007-02-09 14:30:56 UTC
From: Lee Mairs (SAG)
Topic: 17226 Message: 17268

I have had great success with the Rascal interface from Buxcomm in SW Virginia (www.packetradio.com). It keys my FT-897 just fine for all of the sound card modes we use in Navy MARS. Although I bought mine with the USB-Serial interface, I ended up not using it as the VOX mode worked just fine.

17269. Digital modes and duty cycle.

Yahoo group: FT897 (2007)
Date: 2007-02-09 21:10:41 UTC
From: James Wilson
Topic: 17269 Message: 17269

I am now entering two new worlds digital communications and HF. The first thing I realized is that some digital modes have a much higher duty cycle then SSB communications.

I searched both the operator manual and the service manual and I couldn't find anything about duty cycles. I doubt that the ft897 could transmit at 100 watts for 30 minutes.

Does anyone have any information on duty cycles for this radio? I doubt I will be exceding them, but it is still nice to know.

From: Ross
Topic: 17258 Message: 17270

What a coincidence. I've been trying to decide between the 897D and the Icom 706MKIIG. I've been told that Yaesu has a history of selling radios and letting the consumer finding the defects, then fixing the defect for the next batch. I've been very, very interested in the 897D, but now I'm beginning to get cold feet about buying one. Can anyone tell me why the 897D might be a better radio for both HF and UHF/VHF, as well as NSIV? Have any of you had a bad experience with one?

17271. Which features do I need on the 897D?

Yahoo group: FT897 (2007)
Date: 2007-02-07 23:01:20 UTC
From: Ross
Topic: 17271 Message: 17271

I fell in love with the 897D from the first moment I saw it.
Unfortunately, everyone in my net that has a portable HF has an Icom
706MKIIG, which, of course, they say is better. In defending my choice
what can I point out that is better on the 897D than the Icom? I know
nothing about either, except that the Icom has a very enviable awesome
reputation. Would any of you care to help me out with this comparison.
I'd sure appreciate it.
Ross

From: Chuck Graham
Topic: 17253 Message: 17273

I have to agree. I got my Tech ticket last March and a VX7R the next day. Now that I have passed my General and code has gone away I'm getting the FT897D. The VX7R has been a lot of fun and did everything as a Tech I wanted. Now I'm ready to try HF.

Enjoy the hobby,

Chuck KI6DCD

This is IMO a great 2nd radio after your hand held radio. This radio can do just about everything good, nothing well but what do you expect from an inexpensive small all band all mode radio.

But before spending the 800 dollars get the handheld so you can make sure you like the hobby. The handheld will always come in handy.

17275. Help identifying version

Yahoo group: FT897 (2007)
Date: 2007-02-08 19:28:57 UTC
From: Nick
Topic: 17275 Message: 17275

Hi, I've just purchased a FT-897 used and I would like some help identifying the version:

1. Firstly, on the box it doesn't say FT-897D.
2. Inside, it has the TCXO fitted, and the 2 optional filters.
3. It has a N socket on the rear where the 2m/70cms antenna plugs in. On most official pictures of 897's, I see 2 x SO239's. But on mod sites and on mine, they have 1 x SO239 and 1 x N socket. Is this just a mod, or does it tell me anything about the version?

I could post the s/n if that would help anyone...

TIA,
Nick, G7IZR

I'm not sure what handheld you mean. I have a Yaesu VX-7R for my handheld, and a Yaesu FT-8900R in my truck. Neither are capable of HF for NViS. What handheld is capable of HF for NVIS?

I was looking at the Yaesu FT-897D for the NVIS, but some people I know recommended the Icom IC-706MKIIG http://www.icomamerica.com/products/amateur/706mkIIg/ The owner of the local HRO told us that Icom is a little more thorough on quality than Yaesu. Maybe that's why they cost more. I don't know I'm just repeating what i was told.

Thanks for you help.
Ross

All manufactures ship products with defects, and consumers find them. The alternative to fixing them in the next batch is to not fix them. I prefer to have them fixed.

NVIS is a function of the antenna system, not the radio. It means having much of the RF energy go up vertically where it is mostly reflected back down to the local area instead of going out horizontally for DX. In commercial and gov't use, it can also entail quickly and automatically switching between frequencies and bands to find and negotiate open channels, but AFAIK, that is not commonly done by hams.

Ross, I don't know much about the 706MKiiG other that what I've read, but I chose my 897D because I wanted a portable base station, not a mobile on the desk or the picnic table. I also wanted the internal power supply for traveling. (I don't care much about the internal batteries, probably won't buy them.) I also like the carry handle and the ruggedized case, as well as the larger buttons. Icom makes fine products, and opinions vary wildly about quality and features, so there is no winning that argument, but my experience with Yaesu is that it lasts forever. I have an old FT-4700 (20 yrs old?) in my car and other than lacking newer features like millions of memory locations, it works flawlessly. (again, opinions vary wildly)

Nick,

The N-type connector for v/uhf just signifies it is an EU & UK version
of the radio.

The 60m memories might not be enabled (they are not available by
default in the UK).

I presume you bought the radio used?

Those 5MHz memories are not available on UK versions of the 897D.

The option "EMERGENCY" at location 050 of the menu is however there,
but it is not possible to enable it.

I have an 'as new' FT-897D for sale. The rig is in perfect cosmetic and electrical condition. Since it is the "D" model, it has the TCXO factory installed. It has the narrow SSB filter and it has the W4RT speech processor installed in the factory hand mic. The rig itself is unmodified. It also comes with the mobile mounting bracket new-in-the-box. I have only had the rig in the car a couple of times, and then it has been on the passenger seat secured by the seat-belt. Again, the rig is like new.

The only reason for selling is that i have no way to mount it in my vehicle so that the rig is securely mounted, and my wife can go on trips with me. The rig does an excellent job in a vehicle (if the vehicle is large enough to mount it) as the NB and DSP knock out all of the mobile noise i have encountered. I have always received excellent reports on the audio with the modified microphone.

Anyway, about $700.00 would be nice.

73 and thanks for reading.

Hi all,

I have a non-D 897 and use it quite successfully on 60m so I'm not sure why/where the link about 60m and it being a D version comes from unless it is purely the fact that the frequencies are preprogrammed (which mine were not).

Perhaps someone could explain further?

Sorry again if this proves my ignorance!!

I'll take it for $700 if you will guarantee it for 90 days. I understand only the original purchaser has the factory warrantee on the rig. I can send a money order Monday.

The U.S. version of the FT-897D has the 60m frequencies pre-programmed
into memories 601 - 605 (or thereabouts!).
It does not apply to the UK/EU version.

Mine is also pre-D, so the frequencies are manually programmed into
memory.

17288. MH-59 Blues Continue

Yahoo group: FT897 (2007)
Date: 2007-02-10 16:07:55 UTC
From: ka9p@aol.com
Topic: 17288 Message: 17288

Before the last trip to the beach I modified the MH-59 with the well known toroid mod in an attempt to keep the RF out when using it in a pedestrian mobile application.

Alas, still no good, the rig stays keyed up and emits hash on most bands when the PTT is depressed.

Has anyone had to do more - some bypass caps or? and had success licking this problem?

Thanks, Scott

(Still really loving the rig otherwise)

Well either your 897 has had the wide band mod done to it, or you will
find that you will not be able to Tx on 5MHz

John,
I thought that I read that the 897D had the 60m band
and the 897 did not. Did your radio have a mod? BTW,
here is the text from the 897D operating manual, page
23 (downloaded from Yaesu.com):

OPERATION ON 5 MHZ BAND
(U.S. VERSION ONLY)
The FT-897D includes the capability for transmission
and reception on the five spot frequencies assigned to
the Amateur Service in the United States. To operate
on the 5 MHz band:
1. Press the V/M key once to enter the ?Memory? mode
(a
memory channel number ?M-nnn? will appear on the
display in the space previously occupied by ?VFOa? or
?VFOb?).
2. Memory channels ?M-601? through ?M-605? are
preprogrammed, at the factory, with the permitted
frequencies in the 5 MHz band, and the USB mode is
automatically selected on these channels. If you have
partitioned your memory channels into Memory Groups
via Menu Mode No-055 [MEM GROUP], the memory channel
numbers for 60-meter operation will be displayed as
?Ml - 001? ~ ?Ml - 005.? See page 45 for details
regarding Memory Group operation, and page 60 for
details regarding Menu Mode No-055 [MEM GROUP].
3. To exit from 60-meter operatin and return to the
VFO
mode, just press the V/M key (the memory channel
number
will be replaced by ?VFOa? or ?VFOb?). The frequencies
and operating mode for 5 MHz band operation are both
fixed, and may not be changed.

Nick,
I have FT-857D, and original Yaesu manual says (page 33) :
50MHz/HF antenna jack - M type (SO-239)
144/430MHz antenna jack - M type (SO-239), european versions are equipped
with a type-N connector).
So I suppose FT-897 is the same.

Subject: [FT897] Help identifying version

Hi, I've just purchased a FT-897 used and I would like some help
identifying the version:

1. Firstly, on the box it doesn't say FT-897D.
2. Inside, it has the TCXO fitted, and the 2 optional filters.
3. It has a N socket on the rear where the 2m/70cms antenna plugs in. On
most official pictures of 897's, I see 2 x SO239's. But on mod sites and
on mine, they have 1 x SO239 and 1 x N socket. Is this just a mod, or
does it tell me anything about the version?

I could post the s/n if that would help anyone...

TIA,
Nick, G7IZR

Hello
My UK version had 897D on the box but there were no optional filters fitted the spaces for them are there, it has 1 x SO239 and 1 x N socket but there is no mention of the optional TCXO it's no even in the manual I've downloaded other manuals and it's under the index for optional accessories but in my manual it's gone. Did they do away with the optional TCXO I wonder.

From: Robert G. Schaffrath
Topic: 17275 Message: 17295

One subject I have not yet seen appear here is the matter of the ARRL's petition to change the frequency of one of the five channels allocated in the 60M band (http://www.arrl.org/news/stories/2006/10/23/1/?nc=1). If it goes through, 5368.0kHz will be replaced with 5358.5 kHz rendering one unusable channel on the FT-8x7D radios. I am curious if Yaesu would provide a fix to allow the use of the new channel or if we would all need to wideband our radios in order to use it. Based upon Yaesu's position back when 60M became available, I am not terribly confident that an update would be forthcoming. Plus Yaesu stated in no uncertain terms that they would not support widebanding.

17296. Affect of IPO & ATT Controls on Receiver Noise and Front-End Overload

Yahoo group: FT897 (2007)
Date: 2007-02-10 19:16:37 UTC
From: kiheiman_98
Topic: 17296 Message: 17296

There have been a number of recent postings concerning receiver overload in the FT897D due to strong adjacent channel signals. There has also been discussion about the 897 receiver being very noisy, especially on 40 and 80 meters.

As mentioned by several people, the IPO and ATT controls can be used to reduce receiver noise and receiver front-end overload. This morning, I fired up my HP 8640 signal generator and made some detailed sensitivity checks on my FT-857D and my FT-897D transceivers. I measured all bands (HF/VHF/UHF) with the IPO and ATT off, IPO on, and finally with ATT on.

Both transceivers tracked very close in the measured readings. The 10 db S/S+N was about 0.15 uv on all bands. Enabling the IPO option dropped this reading to about 0.35 uv and enabling the ATT (with IPO off) brought the level down to about 1.2 uv. The actual sensitivity change on each band was about -7 db with the IPO enabled and -10 db with the ATT control enabled. As noted by other people, you cannot have the IPO and ATT control enabled at the same time.

I also checked the S meter change on 40/80 meters. With a S6 signal generated from my signal generator, enabling the IPO control dropped the meter to S0. Please note than enabling the IPO control only dropped the audible noise by a couple of DB.

With the IPO control enabled, the receiver is much less noisy and the sensitivity matches what we used to see on rigs 20 - 40 years ago - i.e. about 0.35 uv for a 10 db S/S+N reading.

I would have to conclude that these radios are working as designed and are really not any more noisy that older rigs. The audio is going to sound harsher because the filter bandwidths in the 857/897s are much sharper than that of older rigs. As others have noted, attaching an external speaker greatly improves the sound of the audio, when compared with the internal speaker.

Hi Nick,

For US there are 2x SO239 connectors, for the Europe this is 1x SO239
and 1x N-connector. Be glad with it, its a better connector.

There are two types of TCXO. The TCXO-9 has a better temperature
stability (0.5 ppm) and has a metal cap on the PCB of aprox 8x8 mm.

Mybe you can find the exact type with the serialnumber on the side of
the FT897(x).

The optional filters are not standard in both versions, so they are
added later.

Clint,

Your measurements and conclusions compare exactly with my own on the 857D and 897D. However, the radios do sound noisier than most other transceivers on 80 and 40 metres. This is largely due to the dramatic change in slope of the AGC characteristic as evidenced by the S meter response. The slow agc mod described in dk-mods cures the problem and makes the radio much easier to listen to on a noisy band.

Regards,

Bob VK2BMU

first of all their is nothing wrong with the 897 or 857 its just a few
people out here who believe a 700 dollar radio needs to play like a 10
grand job these radios were a dream in some engineers head a decade
ago buy one i have one and an 857 and hook up a antenna and have some
fun gary n6biz or like i tell some people i know go live in the jungle
if u cant deal with all this remote and computer stuff a ham for 43
years

17303. Re: [FT897] WMR Rigblaster Plug and Play

Yahoo group: FT897 (2007)
Date: 2007-02-11 04:56:52 UTC
From: Joe B
Topic: 17299 Message: 17303

John et al, the connectors on the WMR RigBlaster PnP
are listed below, and what they do:

USB: Provides 5vdc power & emulation of additional
comm serial port (for Rig Control jack on WMR).

DATA: connects to back of 897D to data port for audio,
data and PTT

Green: To PC sound card audio out (headphone or
speaker)

Blue: To PC sound card audio in (microphone or line)

Jack1: Rig Control (using the CAT cable sold by WMR
for your radio brand and model such as Icom and Yaesu)
When you install the WMR RB PnP you can choose which
serial port it becomes by using Windows Device Manager

Jack2: CW Out: provides CW keying using a stereo-type
audio cable from RB PnP to the Keyer jack of the 897.
Does not currently support FSK keying, but the WMR
tech support guy suggested that WMR may publish a
patch to do that some time in the future. Plan to use
AFSK because it is supported.

Jack3: To speaker (that might have been plugged in to
the sound card before you plugged in the RB PnP)

Yes I was lucky enough to get one before the FCC jumped on it.

There seemed to be quite a few changes back then, a lot of the software packages didn't work, widebander was the only one that did.

Mine also has factory moded compression circuit that early ones don't have.

I bough mine from the USA since it came at about half the UK price.

Joe, I'm interested in the Rigblaster line of products, but am frustrated because West Mountain uses inconsistent terminology to describe its products. In several places, all four Rigblasters are called "Rigblaster Plug & Play" products. I want to be sure I understand which specific device you and the others are discussing.

On the main Rigblaster page at http://www.westmountainradio.com/RIGblaster.htm if you scroll down on this (overly-long) page, past "What is a RIGblaster?" and "Features of most models", you reach the detailed descriptions of the four products. Here they are called the "RIGblaster Pro plug & play", the "RIGblaster Plus plug & play", the "RIGblaster Data Jack plug & play", and the "RIGblaster nomic plug & play". Do I understand that you are discussing the third of these, the RIGblaster Data Jack plug & play?

West Mountain might consider hiring a new marketing person and a better Web site designer!

Gary, same question for you as I just asked in another thread. West Mountain calls ALL of its Rigblaster products "Plug & Play". Do you mean the Rigblaster DATA JACK Plug & Play? The others are the Pro Plug & Play, the Plus Plug & Play, and the nomic Plug & Play. See http://www.westmountainradio.com/RIGblaster.htm and scroll down to the individual descriptions near the bottom. Thanks!

17308. external keyer problem

Yahoo group: FT897 (2007)
Date: 2007-02-11 10:31:57 UTC
From: mikewarrington
Topic: 17308 Message: 17308

Just purchased a new ft897 and like others i wanted to use my external keyer. The internal keyer is fine, but like my other rig an ft1000mp it keys in mode "B" which sends extra dots if you are not used to it. My external keyer is an mfj447 (can be set a "a" or "b" mode) it works fine on the ft1000mp but not on the ft897, so it took a while before i went back to how the plug was wired up. Just had to move the wire onto the tip of the stereo plug(the plug that goes into the rig) to make everything work ok. I wrongly assumed the two yaesu radios would be wired up the same, still i know my way around the menus a lot better now. I hope this helps someone as it took me along time to find out about a and b modes, i thought it was me/the key, the new radio etc.

From: Stephen Shockley
Topic: 17271 Message: 17309

There is no hope in winning the Icom versus Yaesu debate. The fact is that they are both great companies with many great products. One has "this" the other has "that"...bottom line is that you will never win the Icom-Yaesu debate.

I have used Yaesu products forever and they simply work forever!! So do Icoms. I did the comparison of the Icoms to Yaesu before I dropped the money for the 897D. For my dollars, feature for feature the Yaesu was the obvious winner. I work mostly digital and CW...very little phone on HF (as in none). The filters that come with the Yaesu are excellent!! Frankly, I just enjoy the radio to no end.

In my truck I run and Icom (IC208H) and my friends can tell the difference immediatly when I transmit from the truck versus the Yeassu base. They adiou quality is far superior on the Yaseu.

Just my opinion but if you are thinking of the 897, buy it and you won't be disappointed.

17310. Band change "feature"???

Yahoo group: FT897 (2007)
Date: 2007-02-11 19:03:55 UTC
From: Nick
Topic: 17226 Message: 17310

If I tune below a band, say tune below 21.000 to 20.999, whenever I go through the bands with the Band Up/Dwn buttons that "extra" band is now always there. I've replicated it by tuning to 27.900 and now that band has been "added".

How do I remove these extra bands so it just goes back to tuning through the ham bands? And it hasn't been modded so it won't TX on them if that helps...

tnx, Nick G7IZR

John,

I agree that graphically the layout is confusing. However, the PnP is the one depicted in this picture: http://westmountainradio.com/Image/P&P.jpg

Please note however, that Plug and Play is used because it has a built-in USB. You will have to follow directions, do it sequentially, and did I say "follow directions"? :~)

Doesn't do everything, but I got mine to do rig control and digital stuff. Great bang for the buck.

17313. No audio with FIL1 or FIL2

Yahoo group: FT897 (2007)
Date: 2007-02-11 19:17:41 UTC
From: lynnmonsanto
Topic: 17313 Message: 17313

Hi all,

I searched the list but couldn't find an answer for this problem: I installed a W4RT CW filter in the FIL-1 slot, and a W4RT SSB filter in the FIL-2. The filters appeared to be recognized because multifunction row "n" shows CFIL, FIL-1 and FIL-2. The problem is that the radio will only "speak" when CFIL is selected on the "n" menu. When I select either FIL-1 or FIL-2, the audio goes silent (just a low buzz). Turning the volumn up just gives a louder buzz. When I select CFIL again, the audio returns.

I did a soft reset (F & VFO/MEM while rebooting) but it didn't make any difference. Any suggestions? BTW, I was extra-careful installing the filters.

Thanks and 73!
Lynn...W6JAE

17314. Re: [FT897] Re: WMR Rigblaster Plug and Play

Yahoo group: FT897 (2007)
Date: 2007-02-11 19:57:22 UTC
From: Joe B
Topic: 17299 Message: 17314

John, you are certainly correct about the inconsistencies in referring to products on the WMR website. That's why I ended up with the wrong unit to start with, and had to pay a restocking fee to HRO. The WMR unit that is best suited to the FT-897D is the RigBlaster Plug and Play (not plus or pro or data jack). It's the one with the red case. It's actually smaller than it looks, measuring in a 3" x 2" x 3/4". I don't even see it on their price list.

I purchased mine at the local HRO store, but it wasn't on their website either. The HRO model # is RB/PP/IYK6MD and it sells for $99.95. Consider ordering the CAT rig control cable too, but HRO doesn't stock that. (CAT Cable for Yaesu FT-100,100D,817,857,897) $12.95 from WMR.

I'm betting that amateur radio could be a more popular hobby if the vendors would actually do some marketing and take some care to improve the content and accuracy of their websites. It's as if they resent having to describe their products and provide adequate documentation.

Got it! Thanks! This is the device that, elsewhere on the Web site, West Mountain calls the "Rigblaster DATA JACK Plug & Play". For example, if you want to order one, that's the name it is given on the following page: http://westmountainradio.com/order_us48a.htm

(It's not so much the layout that's potentially confusing as it is the inconsistent names.)

Wouldn't worry about it, it's normal. I wound up setting my "bonus band' for the regular commercial AM band, the FT-857 is a heckuva AM receiver. You'll find the "extra band" moving around as you trigger changes on occasion by selecting frequencies on purpose or accidently, triggering frequency shifts on the "bonus band".

Nick . . .

The "extra band" is a freebie, not an anomaly.

Relax and enjoy it -- there's nothing you can do to eliminate it.

If you don't like it in the run up from 160 to 10, for example, just move it to a higher (or lower) frequency.

I set VFO-A to SSB frequencies and put the "extra band" on WWV at 10.000 Mcs. (in AM mode, obviously).

I set VFO-B to CW frequencies and put the extra band at WWV on 5.000 Mcs.

You can also put it on your favorite AM broadcast station which effectively puts it below the run-up on HF ham bands.

Consider it a plus, not a minus.

Correction: It *is* the Rigblaster DATA Jack Plug and
Play (as someone pointed out) that I was referring to,
and that makes sense since it connects to the FT-897
data jack. Looks like the price is $109.95 but I paid
$99.95 maybe because it was an open box.

Nobody should have to go through this much effort to
buy a $100 sound card interface.

Ross,

I can tell you what to expect...you can expect to work countries around the globe. You can expect to become appreciative of the stock filters and DSP. You can expect to be surprised that all the features you have at your finger tips came in a $700.00 radio that is military tough, solid throughout, and runs cool under heavy use. You can expect to be very satisfied with this radio.

You can not expect to find these same features for the same price anywhere else.

Just a side note, you can pair a mediocre rig to a great antenna and you will end up with a great setup. If you pair a great rig, say the TS-2000 or so, to a crappy antenna then you will have a crappy setup. No amount of filters, power, processing speed, or fancy lights, knobs, and switches can overcome an inadequate antenna.

My experience & 2 cents.

Mike

Mike,
I completely agree. I have just had the misfortune to read some not-so-good reviews, and questions about problems with the 897D. I just wondered if there was a serial # to avoid, or one to look for, and/or what should be in the box that some people say is missing in theirs.

Thanks for the response,
Ross

Ross,

The fact is, nothing is perfect. Kenwood has had issues with the TS-2000, Yeasu with the FT-1000D, Icom with the IC-706, etc...these things are machines/computers and some fail while others don't. Those that have problems are usually brought to the attention of user groups like this one which is one of the reason's these types groups exists. Don't let those things scare you off. Do your own research. Go to a candy store and play with the rig. Ask questions. Then - commit and don't look back. There will always be a better rig. Just get the one that gives YOU the most bang for the buck and put the $$$ saved on a good antenna and tuner.

Oh, I worked a Hawaii station from here in Georgia today. Got a 59 report (which is great) on my audio and clarity. The FT-897D rocks!

73,

Mike

Thanks for being my cheerleader. I have every intention of getting either a 857D or an 897D, I just don't know which until I look them over real good and someone explains to me why one is better, for some reason, than the other. It's the versatility of the 897D that intrigues me. I don't know of any other radio that all it does.\

I think retuning the 'additional' band back into one
of the ham bands. Next time you power the radio up
the extra band will no longer be saved...

Note I said "I think"!

I saw an IC-706MKIIG last Sunday in the flesh as I helped to do the MARS mod to it. Frankly, I think I prefer the styling and looks to my FT-897D - especially the panel display. I cannot remember why I ended up with the 897, other than it's size is more commensurate with my fat stubby fingers than was the virtually performance identical FT 857.

Gentlepersons:

I am frustrated. I can key my transmitter, I can receive PSK31... I cannot find that my transmitter is transmitting a signal other than a solid tone. So what settings am I missing in my 897?

Thanks for your help in advance.

John

John,

If you have set Menu # 38 (by memory...not with the printed manual) to the correct mode, then it should transmit OK. There are PSK31, RTTY, and other modes which can, and need to be, set here.

From: Ross
Topic: 17294 Message: 17329

Well, I certainly can argue with personal preference on looks. I like the rugged looks of the 897, but nothing wrong with the Icom. However, isn't the Icom 897D more versatile with the power supply and mobility in the field? I would love to see a side-by-side comparison of them. Seems to me the Icom, as nice as it is, does not compare to the 897D for versatility, which is why the upgrade from the 857D to the 897D, or is there something I don't understand about that.

I cannot imagine ever needing to hump my FT-897 across the boonies, so the built-in batteries (at an atrocious price) are useless. All I can envision is connecting to my car battery or another emregency source of 12 VDC power thru Anderson Connectors. The built-in AC power supply also doesn't seem to hold a candle to either of the Astron Power Supplies I already have.

Once again, it is the larger size of the FT 897D that made my decision. Altho I wish I'd looked closer at the Icom 706 MKIIG, I am certainly not suffering any buyer's remorse.

Having humped the 897d to the beach ALOT, I can say that those expensive batteries provide 5 hours of 20 watts from a backpack or a seat on the beach, and are, in fact, priceless.

As is a rig that's always charged and ready to go 160 to 440 if need be, AND can be run out of the Jeep at 100 watts if need be.

I still don't like the audio a lot (compared to some other things in the same price class) and wish it was more sand proof, lighter, and had an internal autotuner, but if it ain't the best darn frequency and feature agile portable radio on the market, I don't know what is :)

Ts'all good.

Scott

That's what the manager of the local HRO told me today as he dragged out his own personal 897D. His words were very similar to yours.

17336. Icom 706MK2G & Yaesu FT 897D

Yahoo group: FT897 (2007)
Date: 2007-02-13 13:35:52 UTC
From: earicci
Topic: 17294 Message: 17336

Good Morning Gang:

I presently own both rigs the 897D for four months and the 706MK2G for six years.

I appreciate both radios -

706MK2G:

Nice large display
Durable workhorse of a rig
compact size
blanker is not adjustable
nice transmit audio

897D:

DSP filtration (stock) reduces need for additional filtering
Internal batteries
Rugged
more precise power output settings
memory groupings
dedicated digital mode and packet
much greater programmability (eg - display, mode settings, CW memories, adjustable blanker, memory grouping, 3 programmable keys)

Each radio has been back for repair. The 706MK2G was back for the infamous D9 diode problem (high swr on 80 and 160 toasts D9). Since repair the rig has been fine.

The 897D had an issue with low power output on 40 and lower. Yaesu had it for two weeks (add a week for shipping). The repair is fine (under warranty). I have yet to take the 897 portable.

$/amp the Astrons were cheaper. Plus, I needed them for my IC-751A 20 years ago when I first purchased the first one, so they are in some sense "free". they are made with discrete, through hole components that are readily available. so maintenance (they haven't required any in 20 years) should be a lot easier than working on something that will fit inside my FT-897.

I purchased used and mine came with the built in PSU, so I didn't get
the original case bottom where the batteries would go (silent key sale
so I couldn't really insist they searched the house for it and it was a
good price!).

So, if I go to the hassle of buying the bottom, how easy is it to swap
between the AC PSU and the batteries or am I better off with an external
12v battery pack?

tnx, Nick

The FT-897 is a great rig for what it's designed for, which is a portable rig. I prefer something with more knobs and less levels of memories to wade through for day to day use, thus I have a couple of radios including an FT-897.

In marketing, the rule of thumb is that average consumer with a bad experience will tell 5 other people about it, while a consumer who is satisfied will tend to tell no one unless asked and someone who has a good experience will tell one other person.

Thus most of the comments we read on eham, qrz, etc. about anything tend to be negative ones. You need to take them all with a few pounds of salt.

My favorite example of this are the reviews of the Anderson PowerPole connectors. Obviously they're not very complicated (two parts!) and with a little practice and the right tools anyone can put them together in a minute. (I've put on maybe a thousand of them with possibly ten mistakes). But when someone can't read the instructions or uses the wrong tool, it's becomes the connectors fault and a bad review results!

You'll enjoy the FT-897!

Although the IC-706MKIIG is a good radio overall a comparison of the reviews of that radio compared to the reviews of the 897D would tend to show that the 897D has fewer failures and may have a better receiver (I've read numerous reports of IMD in the '706). Also, the 706 is about $150 more than the 897D. If you compare the 706 to the 857 (which is really a closer comparison) then the price difference is about $250 and the 857 is actually a better overall radio (IMHO). I'm not bashing Icom - they have several models that I really like;however when you honestly compare the issues and performance between the 706 and the 857/897 the Yaesu gear wins hands down.

One thing that I would like to point out is that if the 857D is comparatively equipped (i.e. the optional TCXO is added) then there is virtually no difference in price between the 857 and 897. Although the 897 is slightly larger than the 857 it actually lends itself better to portable operation with its capability for internal batteries. Also, as small a consideration as this might be, there are more knob-controllable functions on the 897 which makes it a bit easier to operate. Conversely, if you are considering mobile operation I would definitely go for the 857D with its smaller size and detachable face. Although the 897D can be taken mobile its larger size and inability to detach the front panel make it less desirable for that 'mission'.

Ross <dzrtram@...> wrote:
Well, I certainly can argue with personal preference on looks. I like
the rugged looks of the 897, but nothing wrong with the Icom.
However, isn't the Icom 897D more versatile with the power supply and
mobility in the field? I would love to see a side-by-side comparison
of them. Seems to me the Icom, as nice as it is, does not compare to
the 897D for versatility, which is why the upgrade from the 857D to
the 897D, or is there something I don't understand about that.

Nick,
When I get my Ft897, I plan on making a Battery pack
With the 8 amp gell cell batteries from Cabela's.com .
More capacity and a lot cheaper. Two 8 amp batteries/w charger
$50.00. I also have a small regulator,
(24 v input & 13.8 v output). I can look up the web site
if your intersted.

This is so true.
I'm new to HF myself and I almost couldn't make a choice.

You're so right. I'm not sure with my hearing (or experience)
I can pick out what's better or worse among this particular
class of transceiver. Maybe some day I'll graduate to a better
model, but....

The quality if all of them (barring any single 'lemon' unit
here or there) is superb. So, it's down to individual
features, and I finally decided I liked the size of the
FT-897D and future flexibility of having inboard batteries
or a built-in supply, clamp-on tuner, etc.

It's like cars. There used to be significant differences in
quality or design. Now they're all fairly superb quality,
run well, etc. It's all down to whether you want this or
that arrangement of seats, cupholders, trim level,
domestic/foreign, etc.

From: ERICENNIS
Topic: 17346 Message: 17346

Hi everybody. KI6HNB Eric here. I will be purchaseing an FT-897D at the end of the month as my first HF rig. I will be useing it for both in car mobile use and in apartment base station use. I was wondering what kind of antenna you might recommend for a Jeep Cherokee that would be easy to remove and use in the apartment. I don't really want to mount an antenna on the Jeep as it might get knocked off on the trail or fall off as I'm prerunning in the desert. Is there even a mag mount antenna that could do this? I'm not looking to get down to 80 or 160. I would like to be able to work 40m though. At home I plan on powering the rig with a bank of 3 deep cycle batteries that I will charge when I'm not useing them. In the Jeep I have an aux battery benind the drivers seat that I have wired with some 75A power poles and 6aug wire. I will add a 2nd leed from the battery with a power pole for the radio.

From: btwlgw
Topic: 17348 Message: 17348

I'm a brand new 897D owner - so new that I haven't even transmitted with it yet.

I have a Xantrex Powerpack 300 which is one of those all-in-one emergency power supplies that has a compressor, inverter, and car jumper cables. I believe the battery is rated 12AH.

Would it be possible to run the 897D for any length of time at the lowest power setting using this supply?

17349. Expand Freq mod went wrong

Yahoo group: FT897 (2007)
Date: 2007-02-14 03:42:29 UTC
From: dmccord253
Topic: 17349 Message: 17349

I did the Mars Mod on my 897d last night. When I was done I reset the rig and I did not have any extended freq in fact I dont have full coverage of the Amateur bands anymore.

The mod called for jumpers on 9Start from back of rig)
1007,1008,1009,1006

What I had before I did mode was jumpers on 1001 and 1002

When it did not work I pulled out all the jumpers and put 2 back on the origianal places. I now do not have coverate over the intire 80 meter band and 2 meters only lets me transmit 144 - 146

Anyone have any idea what I may have done wrong? I must admit I could barley see the contacts on the board. I beleive that the jumpers are just a connection across the two points, I have been reading and reading everything I can find on the web and there is one post about diodes? An I supost to be doing these with diodes? I am just using very small wires I pre tined so I did not have to apply much heat to the board.

Thanks for any help anyone can pass me way!

Lee,

I just realized that my Astron RS-20A is now 26 years old and has yet to fail on me. I don't recall the cost when I bought it ... but I do know that I have gotten more value out of it than I paid for it. I have been looking as some of the switching power supplies, but have a hard time buying one when the Astron works well.;-)

BTW...I will probably have an FT-897D by summer. Still saving the pennies each month. And chugging along with an IC-703 (has been a great rig) and a number of QRP rigs (KX-1, ATS3A and a couple of single band homebrew). Ain't this hobby great!!!!

17352. FT-100D vs FT897D

Yahoo group: FT897 (2007)
Date: 2007-02-12 12:05:11 UTC
From: Niel Skousen
Topic: 17226 Message: 17352

Other than the obvious fact the 100D is not supported, does anyone have A-B comparisions to share ?

I've been lurking, and am looking for an 897D, but am penny pinching. I have a chance to pick up an FT100D at a very reasonable price. Before I do, are there any 897D's for sale here, (and 'repair-able' is ok for me, the 100d is 'reasonable' because it needs some work) ? Any thoughts or comments on the comparison of the two radios ?

This would be a 'hotel' use setup, not a mobile radio

Thanks all, 73
Niel

From: Louis Perley
Topic: 17313 Message: 17353

Make sure the filters aren't installed upside down. I did the same thing with mine when I bought the Yaesu filters. If properly installed, the N row will show the bandwidth of the filters (500, 2.3k, etc.) When it shows "FIL1, FIL2" it's the radios way of saying it knows something is there, but it can't recognize it.

17354. Noise on 6M Tx, again...

Yahoo group: FT897 (2007)
Date: 2007-02-12 15:42:13 UTC
From: mgrundy@m0ady.org.uk
Topic: 17354 Message: 17354

Hi to all...

I have just started on the FT897 yahoogroups and I saw someone posting
on the "Noise on 6M Tx" thread.

Just before that, I had ordered a new FT897D; it has now arrived
and I have been doing some tests. I have found that the noise is not
only on 6M, but 2M and 70cms as well (usb and lsb - I haven't checked
cw though), using a dummy load on the 897D and monitoring with my FT817
using 'phones.

To check that its not RF feedback through the mic cable or psu problems,
I tried disconnecting the mic. and asserting the PTT via the data
mini-DIN socket as well as powering the 897D with both linear
and switched-mode psus and an 18AH SLA battery. The noise is present
just the same under all conditions.

Looks like sending it back to Yaesu via the dealer is the only option.

From: Brandon Cruz
Topic: 17294 Message: 17355

Ross, I'm not sure what sites you're seeing that flag problems with the FT-897D; however, my research has shown that the 897/857 series have been far more trouble-free than many other rigs. Of course there are features that some people don't care for and perhaps it lacks some features that others may want. However, these types of comments say nothing about problems with the rig and are more about personal preference. Believe me, I wouldn't have purchased the 897 if it had the reliability issues of, say, and Icom 746Pro or IC-703 (I do like Icom products in general but those two particular models have poor track records). Again, compare the reviews pf other rigs to the 897 and I think you'll find that the 897 overall has a exemplary reliability record.

Ross <dzrtram@...> wrote: Mike,
I completely agree. I have just had the misfortune to read some not-so-good reviews, and questions about problems with the 897D. I just wondered if there was a serial # to avoid, or one to look for, and/or what should be in the box that some people say is missing in theirs.

Thanks for the response,
Ross

I couldn't agree more with Gary Wilson.

The other rule is . . . if given a chance to critique something (or somebody), most people will find a fault even if none exists.

A whole generation (or two) has been raised to expect perfection in both products and people (but not in themselves) and always at a bargain-basement price.

Regardless of serial number, the FT-897 is a steal for the money. It is NOT on a par with high-end rigs. It does NOT have close-in numbers. It is NOT a contest killer. But it IS a so-called "DC to daylight" radio and it IS priced slightly above entry-level rigs.

What more can you want?

My opinion only.

Accessing the "ABC"-menu, without FIRST connecting an external, regulated, 13.8 volt power supply, violates the YAESU service procedure! Doing so often results in screwing up the service menu CALIBRATIONS, especially the VOLTMETER. To attempt a correction, follow the correct procedure of using 13.8 volts external power, before and during access of the service menu. Once into the menu, select the "VCC" menu, which I believe is item #17, and be sure it is set to 138. Press the "F" button to save the setting, and then turn the radio off. When you next power the radio on, the voltage display should be correct. The proper procedure, and equipment required, to perform this and other alignment menu functions, is detailed in the YAESU service menu, and if you are not properly equipped / skilled, it is best to seek assistance, because mis-adjustment of some items can DAMAGE your radio.-73, KC3VO, Bob Curry

144-146 MHz is the UK 2m band.
If Tx on 80m is only 3.5 - 3.8 MHz that is also the Uk
allocation.

Unfortunately I'm at work and don't have the info. to
hand. You could ask Peter G0FIM/AA3JN (hope I've got
the calls right ;o)) - he has the harwired
widebanding mod, details he could email to you...

> dejavulva made a file to the group but there is only a short cut and
> no manual??

The service manual is for sale at your local dealer.

That is how I purchased mine.
I think I paid EUR 20,- for it.

Sounds nasty, but really, guys:
- If people copy themselves, then there is no demand, and dealers will stock the transceiver but not the service manual, making it difficult to purchase it.
- If people copy themselves, then it may not be cost effective for Yaesu to even produce the service manual for a future FT-1897D, so the service manual may not be available in the future!

So, The Copy You Made Yourself Now is preventing you from getting service manuals in the future, by any means, for any price.

Which is why I always buy the service manual with the unit.
When negotiating price, the manual is sometimes even thrown in for free.

I apologise for the harsh words.

In the UK the dealers mostly claim the manual is not available as a Yaesu part whether you are willing to pay for it or not.

Other dealer haven□t, said £20 which is steep enough, they ask for £50 to £60 which is a rip off.

The other issue here, we live in an environmentally sensitive society, to be forced to buy it in paper form when it could be made readily available on the manuf. Web site is wrong.

If the manuf. pulls you to their web site for your manual or other info, they have another chance to sell you something, much more expensive than a manual, that□s what web marketing is all about, and really Yaesu should have figured this out a long time ago.

Eric:
You probably won't find an antenna that would work well in an apartment and on your mobile other than a whip (resonant or using a tuner) that you could mount on a balcony railing and provide a decent counterpoise. If you can't put something out a balcony (or if you're lucky on the roof or a light wire out to a tree), then you're probably going to have to use something inside. My personal favorite for that is a slinky antenna along an outside wall with clip leads used for selecting the right number of turns for each band.
Of course the real problem in an apartment is that you often have to keep the power level very low to avoid interfering with other tenants consumer electronics. As such, you don't need too much in the way of batteries to power the radio from home, just a small switching supply or a good motorcycle battery. To make it easy to run at lower power, consider running the 12 V into the internal battery connections on the 897D so the radio runs at 20W.
For reference, I worked all over the world with a slinky antenna and a 5 W CW rig when I was (considerably) younger. It was a challenge at times but a real blast to get those contacts. I've also talked all over the world with a short loaded whip clipped to a balcony railing at a condo with 20 Watts. Of course that will all be easier once the Sun-Spot cycle comes back up a bit.
If you want an antenna that can survive on your Jeep, just put a ball mount on it and use a stainless whip with a good solid (all stainless) spring. I had a Hummer H1 that I ran through the woods here in Northern Michigan quite a bit and I never destroyed a stainless whip--bent them a bit though. To use the whip you'll need a tuner. Try to mount it real close to the antenna and keep the antenna high up on the vehicle (no bumper mounts). The other mobile solution is the cheap HamStick kind of antennas for each band you run. With a quick disconnect you can take them off pretty easy and if you destroy one, it's not that much money to replace them. With my hummer, and now with the new Durango, I have both the stainless whip and a good SGC whip which I use when I'm not going to be hitting much.
Since you already have the Aux battery in the Jeep, that should be fine. The 30 or 40 Amp PowerPoles should be more than adequate for the 897D. Consider getting a charge controller to charge the battery and isolate it when the car's not running (or do you already?).
Good luck with the radio and let us know how it works out for you.

Chuck

The jumpers are, in fact, resistors. merely placing a tinned wired
may not provide the right connection therefore leading to un-desired
operation. I suggest trying to locate said resisrors and replacing
them and see what happens.

From: coloboy77
Topic: 17363 Message: 17363

If anyone is interested, I am going to sell my FT897d. I bought it before X-mas from HRO and
it has just sat on my desk. I haven't even transmitted on it at all, just listened to some 20m
traffic once or twice. Life is too busy right now for HF with no signs of life changing in the
near future. I have the box, packaging, warranty cards, manual, etc.

It is stock from HRO, I did not purchase any batteries or a power unit for it. Pefect condition.

$750+ shipping

Send me an email.

The jumpers are not resistors they are 'Zero ohm jumpers', they may look like resistors but they are not.

The mod that was done is correct. I suspect that you have damaged the pad that jumpers sit on. Some of them have plated through holes in the pads that pmake connections to the tarcking on other layers of the pcb.

Get an ohm meter and check the continuity from the pads to the other places that it should connect to from the circuit diagram.

Are you sure that you had a jumper on 1002 before the mod? I understood that this link limited the 2m band to 144-146. Did you have a jumper on 1008 or 1009 before you started?

What happened when you did the mod, what were the symptoms?

The FT100D has a much wider rx range. Display is larger but non-alphanumeric. Replacing it with the FT-857D is the first time I can think of that a follow-on model had LESS capability.

The 897 is an 857 in the portable case, so you can check people's comments comparing the 857 to the 100 and get a better idea what you want. Check eham.net reviews for more.

Hallo guys,

this message is in order to inform you that at this time we are
publishing
an "Home Made Newsletter" Called HMN (Home Made News), and we have a
newsgroup too, at address
http://it.groups.yahoo.com/group/HomeMadeNews/ .

The aim is to inform and show news about homebrew, websites,
products, and
so on about this theme.
The sheet is mainly in Italian Language, but there are also few
parts in
English as technique materials in the world are in English so we are
trying
to make a semi-double-language newsletter for Italian Hams too!

If you like to receive, freely of course, the newsletter, please let
me
know, and I'll send next issues by email. If you like to see past
issue, we
have a server where we'll put all we want to share with other
homebrewers,
and NL too, at address http://www.eco-lavoro.com/hmn/ that is
splitted in
several sections (in the Bulletin there are the two past issue of
NL).

Hope this is useful for you, have my best 73

From: on4ny
Topic: 17367 Message: 17367

Hello everybody,

I am located in Belgium. I am planning to buy a FT897D in a couple of days as the price seems now to be a bargain for this rig, but I am still hesitating as I have already a collection of rigs. Anyway, this one is planned to be used as portable station for qso from special location during pedestrian walk or bycicle rides (in that cas with the optional battery). What about the FC-30 tuner ? I have read and heard some bad thinks, but also some good advise. Anyway, this tuner as a pretty look for the least ! I was first interested by the new IC-7000 but the FT897D is now at half the price of the Icom, so...and maybe it has also some other advantages ??
Will be very pleased to have some advise.

17368. Re: [FT897] FT-100D vs FT897D

Yahoo group: FT897 (2007)
Date: 2007-02-15 15:17:54 UTC
From: Brandon Cruz
Topic: 17226 Message: 17368

Niel, I have both and I actually do have them on an A-B switch so I can make quick comparisons. Here are some thoughts:

1. I like the receive audio a bit better on the FT-100D. It's not a night-and-day difference; the quality is just a little more appealing to me.

2. The noise blanker on the FT-100D is significantly better than the one on the FT-897D. I have a high noise level on 80m at my QTH and the '100D's blanker can make the noise nearly disappear. The '897D brings it down a tad but not even close to what the '100D can.

3. AM mode on the FT-100D is awful without adding the optional filter. It's as broad as the proverbial barn door - I hear signals 20 KHz either side of center. AM mode on the '897D is quite pleasant.

4. Since I have an auto tuner I really like the auto-CW feature on the '897D. I can have the rig in most any mode and just tap the paddle to tune antenna. On the FT-100D I have to put it in CW or AM mode to tune and then go back to SSB. It's not a big deal but it is certainly more convenient on the '897D.

5. I like the tuning steps and rapid QSY on the '897D. Of course the '100D tuning steps can be changed but the ergonomics of the change seem to be a bit better on the '897D.

6. The receiver on the FT-100D seems to have a slightly lower noise floor. That's not a scientifically proven fact on my part - it's just my observation.

7. For portable use it's hard to beat the '897D with the internal batteries (or the optional internal AC supply). Obviously with the '100D you'll need to carry a separate power source.

8. The FT-100D is extremely sensitive to low voltage. I've found that when running it off of a 12V battery if the voltage dips below that value at all the transmit becomes very distorted. I've not noticed that same sensitivity on the '897D.

9. The 897/857 series rigs have a much better track record for reliability that does the FT-100/100D radios. Many failures were noted with the '100s, particularly with respect to VHF/UHF output. In my case I have one of the last 100Ds that were produced and it has been very reliable. However, if reliability is a concern then I wouldn't hesitate to spend the extra money for the '897D.

OK, I think I've sufficiently muddied the waters. Please let me know if I can provide more info.

Niel Skousen <nskousen@...> wrote: Other than the obvious fact the 100D is not supported, does anyone have
A-B comparisions to share ?

I've been lurking, and am looking for an 897D, but am penny pinching.

I agree completely. In fact, whenever there is a hot debate between a few companies, its my assurance that neither is the best rig, and either will serve me very well. If there was a clear winner, there wouldn't be the debate. Icom/Yeasu, Ford/Chevy, Microsoft/... er, ah, well, forget the last one, its just an enigma. :-) But seriously, the argument really doe's solidify the fact that they are both excellent radios. So then its a matter of personal preferences, and which ones has the right combination of features the buyer is looking for.

FWIW, my 897D is fairly new, but it works perfectly and without any issues. I'd prefer not to have to use menus to access many of the features, but it was a trade off between a larger size rig. The size was more important than the menu, so it won. For others, it very easly could be the opposite decision.

If you have a serious interest in pedestrian mobile operations, the FT-857D would be the better choice .. the FT-897D would really need the AT-897 tuner if you you wish to run manpack portable, and the 897 is way larger and bulkier
than the 857 for such an application ...

I agree with Trish. If you want to use this radio for pedestrian mobile, the FT-897 would seem to be a bit large. I'm not sure why Trish indicated that you would "need" the AT-897, since neither rig has a built in tuner, but a tuner would be nice to have. Between the two, I'd go with the FT-857D. If you want/need a tuner, you might even consider the TS-480SAT. It's a very nice radio, and it has a built in tuner. It's a bit bigger than the FT-857D, but smaller than the FT-897D. But you give up 2 meters and 440 with the Kenwood. Much nicer control head (separable) on the Kenwood though. If you go with either of the Yaesu rigs, I'd also get the optional microphone (MH-59?). It makes it a whole lot easier to make various changes than having to dig through the menus for a lot of things.

Dave:
While the 857 is a smaller radio, it's not really suited to a pedestrian application. The main problem is power control. Yes, you can reduce the power, but power level control is not reliable whereas if you're running the 897D on internal batteries it's going to be 20W max. You'll also need to have external batteries of some sort for the 857, so that offsets the size advantage somewhat.
I agree that the 897 is a bit bigger than one would like for man-pack, backpack, pedestrian use, but the alternatives are problematic. True man-pack radios, which are available, tend to cost quite a bit more than the 897/857 radios. If you have the money, something like a Q-Mac or VX-1210 would be perfect. Of course there's a whole range of other surplus military stuff, but none with all the features Hams like to have. Other alternatives are radios like the FT-817 and IC-703. The problem with these radios is limited power (5 W). The target power level for pedestrian use is more like 20W, although you can have lots of fun at 5W if you're persistent and use larger temporary portable antennas.
The 897D at 20 W on battery power is not a bad choice. Having it fully contained with batteries is a real plus. Also, I've tested my 897D at 20W in a pack with no available ventilation and it barely gets warm even with 1/2 hour key-down at 20W CW. You will still need some kind of antenna or tuner. A tuner like one of the small LDG's could be mounted in a pack to do the job and/or a light-weight (Flex-Weave) dipole with a tuner is perfect to carry for temporary fixed use. I suppose an antenna like an ATAS-25 could be used, but not sure how effective that would be for in-motion use. Other options are things like a Buddipole system (great stuff), but that's more to carry and again is better for temporary fixed use.
Well, that's my 2 cents on this one. Personally, I'd like to have a Q-Mac, but that's not in my future. I did have a PRC-2000 for a while, which was a great functioning radio, but that was way heavy to pack around much. Gave me a good workout though. I do have an SG-211 mini tuner, so I'm hoping to figure out how to get that into my pack with the 897D and a military style whip as a replacement for my PRC-2000. If I do that, I'll still have room in the pack for lunch.

17375. power output in PSK

Yahoo group: FT897 (2007)
Date: 2007-02-16 16:36:43 UTC
From: Chris Gibson
Topic: 17375 Message: 17375

As a result of many helpful comments from this reflector I bought a secondhand FT897D (from a list member) and am beginning to enjoy this very solid bit of kit.

Maybe you could help me understand better the question of power output on PSK31? First, what is the maximum power output in that mode on the HF bands?

And how should I go about achieving a given power output (say 35W) in PSK31? So far as I can see there are two relevant menus, namely Menu Mode 075 (allowing me to vary the maximum output on the current band) and Menu Mode 037 (allowing me to adjust the audio input level from the soundcard). Should I leave 075 at the 100W default level, and then vary the value in 037? Or should I vary both, and if so how? I welcome any advice.

i have the 80- 20 on a single mast and feedline youll need a tuner
i have the ldg897 people say they work like a dipole but the
radiation pattern is like a vertcal fiqure that one out i say the are
hd tv ants others say they are bird feedders you will work dx with
them mine are up 35ft use good double shielded feedline and im
warning you now they have to be tweaked but they work good luck

Leave the power at 100W (menu 075) and the audio level (menu 037) at 50.
Use the Volume Control on your PC to adjust the audio level input to the
radio. Depending on how far away the frequency that you want to transmit
on is from the base frequency, you may need more or less drive. I generally
limit my PSK power output to between 25 and 30 watts this way. If you are
using the data jack, make sure that you select PSK digital mode (although
USER-U or USER-L may also work).

Hi Chris,

I am sure you will get many different responses to this because there are a lot of ways to accomplish the task. Whatever way you choose, keep an eye on the ALC readout. It should just barely deflect at whatever power you are running. What I do is set the power level to 25 watts simply to limit maximum output in that mode. Then I adjust the DIG GAIN (MENU 037) to whatever makes the ALC reading barely deflect. That should ensure a nice clean PSK signal.

Most of the stations I work around the world are running less than 40 watts. From my experience, I have never needed much more than 25 watts to work the world on 20 meters using a simple 2 band fan dipole. I am unaware of any special power limitations for PSK but others may be able to clarify that.

Hope you enjoy the rig!

In my experience, this is how one sets the level for FSK, not PSK. The
modulation point at which IMD occurs in PSK is well below the point where
the ALC kicks in. Using the procedure above will probably not make you
any friends because your IMD will be high and you will be splattering all
over the band. Your input level should be much below the point where the
ALC kicks in. Just remember that IMD stands for interMODULATION distortion
and is a function of the audio input level, not the power output level.

I've done quite a bit of research talking only to people who have owned or extensively used the 897D and the Icom 7000 and 706MKIIG, as well as other similar radios. I don't see any other radio that is as portable as the 897D. When comparing the radios by feature and price the 897D always seems to come out as the best buy IF you want a really portable radio. Here is a link to a comparison by a man who has had lots of experience with most of these radios.
http://www.ae7q.net/board/phpBB/viewtopic.php?t=329
This should help anyone see that for the money you can't beat the 897D.

Patrick,
I used to own an 897 but I didn't like it.
As a portable rig, it's unbeatable. As a base rig I felt it lacking.

You say that you want it for walking and cycling.
The 897 is too heavy for both.
I do a lot of bicycle mobile operation.
The 897 with batteries is heavy. I wouldn't like to try and store it
on a bicycle. Personally, I use and FT-817. A lot smaller and lighter,
and the lower power just makes it more fun.
I can fit the 817 to my bicycle and ride and use the rig at the same
time. Not something that can be done with the 897.

Have you considered the 857?
This is the same rig as the 897 but in a smaller case.
This rig also as the ability to remove the front panel.
A super rig for the bicycle. You could mount the rig and the battery
on your rear rack and just have the front panel on the handlebar.
The 857 is cheaper tan the 897.
The 857 on a bike with the ATAS 120 would be a great set up.
It's something I'm looking to do when I get a bit of spare cash.

An FT-857 and a sealed gel cell battery can take up less space than an
897, and you can split it between two panniers, this will help balance
the weight.
Give it a thought.

Darren,
I agree that the 897D is not the ultimate base rig, but I would appreciate it if you would point out what you say is lacking. I do not CW. I need a portable for my truck and field work, but NOT contesting. I probably would use it in the house, but not for serious DXing. It would not be for pedestrian use, such as a manpack or riding my bike, etc. I need a very portable compact unit that I can unplug in the house and set on the seat of my truck and go to work. My use is mainly for an emergency net that we have in mountainous terrain with valleys that not even a UHF/VHF repeater seems to get into. We will use NVIS as well as other modes of operation where NVIS is not practical, such as in one of our yearly horrific fires in So. CA. I am really new to this, so if you would be so kind as to elucidate on the shortcomings of the 897D I would be forever appreciative.
Thank you
Ross

Ross, I have made many comments on this group as to why I disliked my 897 so much as to sell it.

I hated the menu system.
I hated the way it sounded.
The DSP I found to be not much use at all, and it made everything sound weird. I'm sure mechanical filters would have been much better.
I didn't rate the receiver that well. It was either too hot or just poor. I could get decent copy of signals on my other rigs that the 897 couldn't get clear.
The cooling fan kept comming on whether or not it was needed, even when the power was turned down to QRP levels, key the mic and the cooling fan came on. This annoyed the hell out of me!

My other rigs are an FT-817 and an old FT-900.
Both of these outperformed the 897 in the receiver dept.
My 900 is filtered up for both SSB and CW. It's superb.
Often during a contest or busy times I would find myself struggling to hear a station on the 897 even with the DSP doing it's best.
It's switch the antenna to the FT-900 and all would be well. Other station copied and QSO in the log. The 900 cost me 350 UKP second hand with the internal ATU, the 897 cost me nearly 1000 UKP new. I wish that I had saved my money.

If I didn't have the FT-900, I'd probably have been happy with my 897.
The 897 is a good rig. It's multiband. It has decent power on V/UHF.
It as lots of nice features, but as a mainly HF QRP op., it didn't do anything special enough to warrant it's cost.
I do believe that you would be better off with the 857. It's a lot cheaper and easier to pack away or carry about. The 897 maybe small, but it's not small enough to be a workable manpack rig. You'd be better off with an 857 and a small battery. Remember that the 897 batteries are not that big and when running on internal lower, you get lower output power. Feed the 857 with 12V and you'll get 100W out should you need it.
The 857 has all the bad points listed above, but it's better designed and easier to use. The layout is much better, though strange at first.The detachable front panel is a real boon too.
My FT-900 has a removable front panel, it's such a shame the the 897 doesn't. The two rigs are about the same size. The 900 has all the buttons and knobs you need on the face, the 897 does it all by menu.

As soon as makers realise that menus are the work of the devil the better :)

I hope that this has been of use. On this group I am in the minority. I disliked my 897 enough to sell it after just over a year. The majority on here like their 897s. I thought that I did, but soon realised that I just told myself that so that I didn't have to own up to myself that I wasted 1000 pounds. It took a lot of courage to tell my wife that I was selling my 897 and why. That money would be mighty handy at the moment!

The 897 is a nice rig, but it could be a whole lot better.

17389. Re: tuning of a magnetic loop by the rig, like ATAS120

Yahoo group: FT897 (2007)
Date: 2007-02-18 09:12:24 UTC
From: gaborjordan
Topic: 8473 Message: 17389

Dear all,
I've moved to another house, I have space now under the ceiling, so I made already a larger magnetic loop. Second thing after kitchen furniture :-)

I picked up this automatic tuning topic again, because now I use wacuum variable, and a stepper motor to drive it. I've already made a controller+LCD to count the steps, so I know where I am (the zero setting is done by a clutch, so I turn 12 rotation to one direction and than I'm sure at the end).

Now I want to add a serial interface, and get the tuning done by the controller.

Similar like external controlled ATU does. It requests the tuning signal, the VSWR~, the freq. It keeps updating the VSWR while it tunes internally than it switches back to normal operation.

The beauty of the stepper is, I know already what range the band is, also, one turn takes less than a second, so tuning time would be very short comparing to the loading coil ATAS.

Do you know someone did this or similar already ?
I have never talked with the rig yet on CAT, I've used serial communication with the PC, but ther I've controlled each end. I'm not well experienced with the USART.

Any advise, suggestion is welcome.

Regards,

hg9hJG Gabor

Yeah I have to agree...These are all pretty lame reasons to not buy an 897...A bicycle?...c'mon...Didn't he say he was new at this...BUT IT!...Most of us have have owned several different rigs...And we own an 897 now...Whats that tell ya? How many rigs for this money will do all the bands all modes and have these options...None...

Patrick, I used to own an 897 but I didn't like it. As a portable rig, it's unbeatable. As a base rig I felt it lacking.

You say that you want it for walking and cycling. The 897 is too heavy for both. I do a lot of bicycle mobile operation. The 897 with batteries is heavy. I wouldn't like to try and store it on a bicycle. Personally, I use and FT-817. A lot smaller and lighter, and the lower power just makes it more fun. I can fit the 817 to my bicycle and ride and use the rig at the

same time. Not something that can be done with the 897.

Have you considered the 857? This is the same rig as the 897 but in a smaller case. This rig also as the ability to remove the front panel. A super rig for the bicycle. You could mount the rig and the battery on your rear rack and just have the front panel on the handlebar. The 857 is cheaper tan the 897. The 857 on a bike with the ATAS 120 would be a great set up. It's something I'm looking to do when I get a bit of spare cash.

An FT-857 and a sealed gel cell battery can take up less space than an 897, and you can split it between two panniers, this will help balance the weight. Give it a thought.

Niel . . .

I have both.

Get the 897D for hotel use.

The 100D is a mobile radio which CAN be used portable, but you have to drag along a PS to use it with AC.

Get the internal PS made for the 897D. You won't be sorry.

My opinion only . . .

Hi all,
I have only been involved in this group for a short while, have been an amateur for two years. I hold an Aussie Standard class licence. I am amazed at the critisism of the fine FT-897D. Yes, it does have it's shortcomings. No, it is not the perfect base station radio, no, it is not the perfect mobile or portable radio. What it is is a good compromise of all these things & for the price it is very hard to beat. The layered menu system does take some getting used to & if you're an old timer or not used to computers then it will certainly be a steep learning curve. I use mine as a base radio feeding a Hustler 5 Band Trap vertical antenna for HF & a Diamond VX1000 for 2m & 70cm. I use the speaker in the FP-707 power supply because it is much better than the one on the radio. I liked the FT-897D so much that I bought an FT-857D for my car. I use an ATAS-100 screwdriver antenna for HF & a Comet SBB-5 for 2m & 70cm. This is basically the same radio as the 897D in a smaller package, but the menus are essentially the same. For the record, I also have a VX-7R & an old FT-757GX Mk1 for portable " throw a wire over the tallest tree" work with an FC-707 ATU.
Personally I reckon it comes down to this. The Icom verses Yaesu war will never be won. If you are an Icom man you will never buy Yaesu & vice versa. ALL radios will do the basic function of allowing you to talk to other people via the airwaves. If you dont like the "extras" that Yaesu offers, you will buy Icom & vice versa. I say "Vive la difference".
So if you want a perfect dedicated base rig, go & buy one. If you cant afford it buy an FT-897D & get something pretty close & stop whinging. If you want a QRP rig to use in a backpack, buy an FT-817. If you want something for your car, try the FT-857D, IC-706MK2G or IC-7000.
Prior to getting my licence I had two Icom communications receivers,

an IC-R71A & an IC-R7000, both of which were brilliant but which had to go to finance my FT-897D.

That's my opinion,
73, Peter, VK5HPC.

From: Einar Kjartansson
Topic: 17367 Message: 17395

One of the pins on the power connector on FT-857 can be used to limit power to 20W
According to user manuals the weight of
FT-897 is 8.6 lb (3.9 kg) (w/o Ni-MH battery, antenna, Microphone)
FT-857 is 4.6 lb. (2.1 kg)
This difference is surpricing, considering how similar the two radios are.
When backpacking, weight is usually more important than bulk.

I am planning to use the battery from my laptop komputer, a lion battery
that has a capacity of about 5 Amp hours, with the FT-857. The weight of the battery is about
half a kg. I have a portable manual tuner that weighs about the same as the battery,
but by using a V dipole of correct dimensions, a tuner can be omitted.

17396. Ft-897D and MH-59 DTMF tones

Yahoo group: FT897 (2007)
Date: 2007-02-17 13:48:08 UTC
From: John S. Gaythorpe
Topic: 17396 Message: 17396

I checked through the forum messages but could not find anything specific on my problem, except an illusion to a recall.

I have a FT-897D and just bought a MH-59 so I can easily enter DTMF tones. I have set option 59 to RMT.

The MH-59 works with voice (I was on an ARES net during the week) but the DTMF tones do not appear to transmit. I have an FT-7800 next to it that works fine with the same Echolink nodes.

Any thoughts?

Should I mess with any of the other MIC options?

Thank you for any input.

John - KB1OKH

Brian:

I don't know if there are any other FP-30 compatible aftermarket supplies (since this is a special supply specifically for the FT-897). I have, however, seen some mention of people adapting other small switching supplies to use with the FT897.

I am just checking in to say thanks to all of you who have contributed questions and answers. I am about to take my FT-897D on a long field trip. For the next 3 months I will be touring in New Zealand, Australia and the Pacific (by cruise liner) and will try to exercise the 897D and ATAS-25 as often as possible. I am also carrying a small, homebrew mag loop antenna. Current plans are uncertain as to times of day but most of my opportunities will occur around sunrise and sunset in whatever time zone I find myself. You may hear me as VE3HPL, VK4AFT or VE0HPL on or around
40 M CW - 7030 and PSK - 7035.15 +
20 M CW - 14065 and PSK - 14070.15 +
30 M CW - 10140 and PSK 10142.15 + (perhaps)
and SSB should conditions be good.
I will not be monitoring the list after Friday but I will checkin from time to time. Again thanks to the members. While I contribute only occasionally I, like many others I'm sure, benefit greatly from the list. I will try to report relevant experience back to the list.

17399. RE: [FT897] Ft-897D and MH-59 DTMF tones

Yahoo group: FT897 (2007)
Date: 2007-02-18 21:21:55 UTC
From: John S. Gaythorpe
Topic: 17396 Message: 17399

As an additional note to this: When sending the DTMF tones (PTT pressed) I can switch a regular telephone on and dial a number using those tones, so I know it is sending correct DTMF tones. But the FT-7800 next to it will trip the Echolink node while the FT-897D does not.

I checked through the forum messages but could not find anything specific on my problem, except an illusion to a recall.

I have a FT-897D and just bought a MH-59 so I can easily enter DTMF tones. I have set option 59 to RMT.

The MH-59 works with voice (I was on an ARES net during the week) but the DTMF tones do not appear to transmit. I have an FT-7800 next to it that works fine with the same Echolink nodes.

Any thoughts?

Should I mess with any of the other MIC options?

Thank you for any input.

John - KB1OKH

Similar thing happened to me. In my case it was the way the node handled the tones at the other end. Not all tone generatoirs are equal. Seems some nodes can handle tones that are a "little off" whilst others cant. The person who has the node can tune the node to allow for a little variability in the tones that are presented to it.

In any group like this, 99.9% of the people are satisfied that the radio was worth their investment; 0.1% aren't. All reasonable people wish there were some things it would do better. Generally, you'll get about 4 replies from the 99.9% and two replies from the 0.1%. That will make it look like a third of the people aren't sure they got their moneys worth.

None of these replies will really address the question of whether this radio will be worth your investment, especially if you don't state how you intend to use it, what you expect from it, or to what you are comparing it.

Most people can read mixed case text more easily than all caps. On the Internet, all caps generally is used for shouting, so many will take exception to it as being rude, and are likely to not answer or to answer rudely. (While I understand it, I find it kinda funny that some take strong exception to it on a group oriented toward people that likely use communication modes that don't even include a distinction between upper and lower case.)

Just to keep you guessing, I'm not going to indicate if I'm with the 99.9% or the 0.1%. However, if you will state more about why you are looking at the radio, we may can provide you with more information. Also, the archives of this group are available, and contain much information that people will not bother repeating. I recommend spending some time there before giving us more information. You can probably tailor your questions to ones detailed enough to get informative replies.

I'm beginning to see through some of the negative reviews. Sometimes people did get a lemon, but most of the time they either don't know how to use it properly or they want to use a particular radio for something other than it was made for, or they compare it to a radio that cost hundreds, or even thousands more $$$$. As far as the 897D goes, in my not-so-humble opinion, there is not another radio on the market that is comprable to what the 897D is built for, and that is portability at a reasonable cost. Other radios might be prettier, or even have a bit better audio, or readout, but most of the radios these guys compare the 897D to a more costly radio. Not hard to see through that. Check out the reviews here http://www.eham.net/reviews/ and you'll see what I mean.

I suspect the way the echolink radio is connected, is causing "tilt".

DTMF uses 2 tones which should have roughly the same amplitude.
Incorrectly configured (or badly implemented) de-emphasis at the
echolink receiver will cause the high tone to have a much higher attenuation
than the low tone.
Hence, the amplitude difference will prevent the DTMF decoder chip
from operating correctly.

I've done a few measurements myself and these chips are remarkably
resilient, but people who sufficiently break the audio path can
cause these things to fail.

You can try and see if changing the deviation (mic gain) will make
a difference, but this will always be a workaround.

Correctly fixing this requires sufficient measuring equipment and
people knowing how to drive them (the latter is the difficult part)

Noet that many repeaters etc are using ex-PMR equipment that was
set up for *phase modulation* instead of *frequency modulation*
as used in the amateur service. A PM transmitter, when received
on an FM receiver, will be +6dB/octave and most ex-PMR FM receivers
have de-emphasis filters, which are frequently incorrectly left in
the audio path. If you then send DTMF over regular FM, the resulting
tilt will cause decodes to fail.
(this topic is controversial - a number of experienced PMR techs
do this, um, different than what the standards dictate.

Unfortunately you can't check with my repeaters, but I expect
the problems to be at the other end.

Have you tried transmitting them to somebody listening on a receiver to ensure that they are not being transmitted? If they are being transmitted properly, the listening ham could use them to dial a phone.

Unbiased? Isn't that an oxymoron? If you have an opinion doesn't that mean you like or you don't?
How does that differ from a bias?

Maybe we could give you an unopinionated bias?

I seem to be the only person with negative views of the 897.
As for not knowing how to use it properly... Yeah right!
Having used many different rigs (Including valve driven) from
different makers over the years, I think I now how to drive an 897.

As for comparing it to a 1000+ dollar rig.... The rig I compared my
897 with was a 15 year old FT-900 that cost me <400 UKP.

At best the 897 was only as good as the 900. Most of the time it
lagged behind.

As a portable rig it's very good,even unbeatable as a field rig, but I
do believe that the 857 and a battery would be better, lighter and
more compact. It would also be a lot cheaper. If ever I get the spare
cash, this is the option I will take in future.

As my 897 was 80% shack and 20% /P, it was not the rig for me. On HF
it just didn't perform anything like I had hoped it would. Maybe the
900 spoiled me, I don't know.
Please don't accuse me of not knowing how to drive a rig.

Topic: 17394 Message: 17407

Darren,
My comment on that was a general comment made after reading dozens of reviews of the 897D. It was not aimed at you, and it wasn't sent to you. It was a general response to another person's message. However, I will say that there seems to be something different about your experience. Check out these reviews. These guys judge harshly, but 193 reviews with a 4.7 out of 5 possible is nothing to sneeze at. Are you sure you weren't expecting more from this radio than what it was designed for. A lot of people are comparing this radio to one that costs twice as much. I can buy this radio new for $799, some of the radios some of these guys are comparing it to cost twice as much and more, and will not do what the 897D will do.

http://www.eham.net/reviews/review/32337

http://www.eham.net/reviews/detail/2432

Concerning the 857 use you should read this from a very experienced person:
While the electronics of the 857 are pretty close to the 897, the packaging is considerably different and therefore the ergonomics are completely different. Considering that the 857 is designed to be primarily a mobile rig, I'm surprised at the number of controls you can't easily see and read from a normal mobile position. I suppose it's fine once you get used to it, but it's likely to be klutzy till then. As such, I don't
Think it's a good choice if it's going to be used by others (such as for emergency operations). The very different packaging means that the 857 is nowhere near as thermally robust as the 897. To begin with the 897 has about 5 times the fan capacity. It also doesn't have the advantage of being optionally run on internal batteries and is therefore not really suitable for field operations.

I'm wondering if you had a defective 897D. Whatever......my message was not aimed at you. Sorry you took it so personal.

17410. car batteries

Yahoo group: FT897 (2007)
Date: 2007-02-19 11:15:06 UTC
From: Roger
Topic: 17410 Message: 17410

I wonder if any one can help with this question.
Is it safe to have car battery on perm float charge 13.8v
as what Im thinking of doing is connecting a car battery to my shack
psu by running a cable out side to a battery so if we have a power
cut the shack stays on

I know I would not have a problem using sealed lead acid
but i have a few car batteries in good condition that i want to use

the psu is 13.8v 35 amp
the batteries are 12v 45Ah
all i was thinking of doing its the feed between the battery and psu
is put in 2 fuses of 20amp rating in both lines
reason for batteries outside is for safety and keep any gasses out in

I look forward to hearing your returning comments on the FT897. Just wanted to drop you a line to say that I took a cruise up the 'Inside Passage' to Alaska and took my FT8800. I got permission from the ships radio officer to transmit from the room and made many wonderful contacts with some interesting folks on the trip. Using IRLP I contacted my home club repeater system and kept a running commentary on the cruise. Enjoy!

Subject: [FT897] Thanks to all!

I am just checking in to say thanks to all of you who have contributed questions and answers. I am about to take my FT-897D on a long field trip. For the next 3 months I will be touring in New Zealand, Australia and the Pacific (by cruise liner) and will try to exercise the 897D and ATAS-25 as often as possible. I am also carrying a small, homebrew mag loop antenna. Current plans are uncertain as to times of day but most of my opportunities will occur around sunrise and sunset in whatever time zone I find myself. You may hear me as VE3HPL, VK4AFT or VE0HPL on or around
40 M CW - 7030 and PSK - 7035.15 +
20 M CW - 14065 and PSK - 14070.15 +
30 M CW - 10140 and PSK 10142.15 + (perhaps)
and SSB should conditions be good.
I will not be monitoring the list after Friday but I will checkin from time to time. Again thanks to the members. While I contribute only occasionally I, like many others I'm sure, benefit greatly from the list. I will try to report relevant experience back to the list.

The first thing that comes to mind is that the 817 is QRP: 5 Watts. The 897 is "full power": 100 W on HF. That alone puts them in different categories.

If you want the most portable unit on the market you probably want the 897D. Costs a bunch less, too. The 7000 probably is a bit better for a stationary base station and/or a mobile, if you don't want to take it out of the vehicle and set it up for field use, which you can do, but is it as easy to use as the 897D? I don't know. I'm having the same difficulty choosing between the same radios. I wish we could get a really good itemized comparison--at least a brief one on the best, most needed features. I don't CW so I don't care a bit about that. I do care about having a very good HF base station that I can pick up and sit on the car seat and work until I get to a field operation. I don't know of any radio that does better than the 897D for that, but if there is one I wish someone would explain what and why.

Personally, I'm tired of reading general comparisons of the two radios. This get discussed on this list frequently. You can search the archives of the list for "7000" and find more opinions than you can shake a stick at. As all opinions, they are biased due the prior experience of the user and their priorities. You can download the user manuals for both radios and do your own comparison based on your personal experience and needs, then you can better understand others' opinions.

Both are excellent choices for many uses, but one may be better suited for your needs. You can do the comparison of features that you think that you are likely to use. If all else fails, flip a coin. Then, after trying that one on mentally for a while, see if you wish the coin had landed on the other side. Then buy which ever radio you wish the coin had landed on.

The good part is that which ever radio you get will alter how you operate; you will begin to get used to the features of your radio, and will then find the other lacking in features that you use. Of course, if you had chosen the other, you would feel that the other's features were more important. I especially like discussions of which menuing system is better: obviously the one that works better is the one that is the most similar to the one the user is used to using. (How many forms of "use" is too many in one sentence? I'll ask Dr. Suess.)

As long as you expect to spend months (years?) learning how best to use the radio for your purposes, either radio will be fine. It all shades of white! The ones who are likely to be truly dissatisfied with either are the ones that expect one of these to work just like some other radio, or expect the radio to do everything without the user having to understand the radio. The first class should stick with the radio they are used to, the second should buy a CB.

Will you find features you would like, or would work easier: of course. A radio that has all of the features one could want are only available on the i version (imaginary); they will come with lossless transmission lines, noiseless antennas, and perfect grounds.

I recently looked briefly at the reviews on eham for either the 857 or 897. In 2005, 2006, and so far in 2007, there have been three bad reviews, ("bad" being 0-3 on scale of 0-5). Some of those are, well, strange. I think that pretty much rules out there being any major problems with the radio. Of course, unless you are willing to pay $5000 for a toilet seat, you aren't going to get a radio where every component was stress tested before being assembled into the radio, the the radio fully tested while cycling through heat and cold, and a

guaranty that there are absolutely no manufacturing defects in any radio. However, people in general seem pleased with Yaesu's customer service, their number of shipped defects, and their honoring of warranties.

I would be interested in hearing why you choose which radio to buy. You could compile a list of features you found important, along with why they were important to you. That would add to the general body of knowledge that would help others.

[Lots of good stuff snipped]

The real answer is to go out and buy both the FT897(D) and (your
choice of IC706/IC7000/FT990/FT857/FT817). Keep them for two
years, using them as you would and then sell one if you wish. My
bet - most people will keep both.

Hello Brian,
The notion that the FT-897D is better than the 817 is purely subjective. I think it's better in my application because it is bigger, easier to see & my huge fingers dont cover two buttons at the same time ! I also am using it as a base station radio & I want the full 100 Watts output.
Now, If I wanted a QRP radio that was portable, lighter & easier on the batteries, I'd have to say the 817 is better, but I don't want it for that. Menu wise it's neck & neck. The 897D was derived from the 817 in the first place, as was the 857D. I also have a 857D for the car. Horses for courses. Similarly, I chose the 857D over the 897D for the car because it suited the purpose better. So, from my point of view, it wholly depends on your needs & intended purpose as to which is the better
radio. Each one has its merits & each is a brilliant radio in it's own right.
Peter.

I have owned both and if I had to do it over I would only buy the 897 for my needs however your mileage might very the big difference is the 817 is a qrp rig only the 897 is a qro rig 817 can switch 6m to either front antenna connection or rear connector 817 is lighter 817 is better for back packing, 897 can't switch 6m out put 897 is a little more rugged (imo) 897 is heavy does not back pack as well but has the power to get out when you need it. So unless you are really into qrp and back packing then go for the 817 if your not go for the 897 the 897 also makes a good base station rig.

Yes. Since I got it last year it's been the only way I've used it. However before purchasing it I borrowed a friend's FT-897 and took it on a trip to see how it worked out. At home I also have as my only other rig a Yaesu FT-840, which is more or less in the same price range as the FT-897D. If I had to pick between the two for HF I would go for the FT-840 (now discontinued). For me the FT-840 is more ergonomically friendly. No menus, and the buttons, knobs and switches are single funtion. I also just like the sound of my FT-840's receive audio better (yes I compared using an identical external speaker). The FT-897D is just a more "fiddley" radio. However if you factor in that the FT-897D has 6m, 2m and 70cm then there is no contest. That is why I bought the FT-897D, to get a reasonably powered, all mode HF/VHF/UHF rig. I've got a hankering to get onto 6m. Plus I can take it on trips. I'm thinking about getting the internal switching power supply though because when I borrowed my friend's rig I didn't like the idea of having to drag along a separate power supply. My trips are not camping trips so having AC power available is not a concern.

If I had to have only one rig, wanted a base station with portability and VHF/UHF all mode capability then I think the FT-897D serves the purpose quite nicely. Even if I didn't figure in the portability factor I still think it makes a good (not perfect) all around base station rig.

<>I have used a Yaesu FT-840 since 1993. I bought another FT-840
in 1998 and
another in 2002. I had the FT-840 coupled with a Force 12 C-3
antenna, AL-811
amp and the MFJ-989C tuner. I bought the FT-897D from HRO in
Atlanta in
September of 2004 and put it in my station setup. I work RTTY and
use an
AEA PK232MBX. I like PSK31 and use the Rig-Blaster interface.
I worked some 60 meter and the FT-897D does it well. I mainly use
my 897D
as an HF base station and don't use the 6 meter or 2 meter bands.
I have other
rigs for those bands. I guess I just wanted to upgrade to a newer
rig as my FT-840's
were getting old. I have 324 confirmed. The 897D is a nice rig
and works well
after you get to know the menus.

Just my thoughts,
Bill Barbee W5LV

As long as you understand that after a few power cuts in which your car battery is used like this, the battery will be toast, then OK. Car batteries are designed to provide a lot of power for a very short period of time and then be recharged. If you use them to provide low power for a long time and discharge them more than a little bit, they go bad. But as long as you're prepared for that, it's a viable strategy because you can get car batteries for much less money than you can get deep-cycle SLAs.

I suggest you look at ARRL's book Emergency Power for Radio Communications, by Michael Bryce, WB8VGE.

Heck I use an astron 50 amp power supply that has had the modification for float charging a battery then I use a yellow top optima battery the power supply has shut off twice since I put this together and everything works fine and the battery can supply power for up to 48 hours at least that is the longest I have tested it for

A lead acid battery, reguardless of type, should float at no more than 13.2 volts. Anything more will tend to shorten the life of the battery even if you can keep water in it.

I wonder if any one can help with this question.
Is it safe to have car battery on perm float charge 13.8v
as what Im thinking of doing is connecting a car battery to my shack psu by running a cable out side to a battery so if we have a power cut the shack stays on

I know I would not have a problem using sealed lead acid
but i have a few car batteries in good condition that i want to use

the psu is 13.8v 35 amp
the batteries are 12v 45Ah
all i was thinking of doing its the feed between the battery and psu is put in 2 fuses of 20amp rating in both lines
reason for batteries outside is for safety and keep any gasses out in

Although I agree with the original author that the IC-7000 is a superior radio in many respects when compared to the FT-897D I think some additional points should be considered. One, with most people cost is a factor. One could purchase an FT-897D and quite a few accessories, antennas, etc. for the cost of an IC-7000. Secondly, I think the one factor that is often overlooked when discussing portability is the power source. Yes, the FT-897D is bigger than the IC-7000 but it has the ability to hold 9 Ah of battery capacity. If you use mobile rig like the '7000 or the '857D for portable operation you must also carry batteries and cabling in addition to the rig. In my mind having to carry a separate power source tends to offset the size issue. Thirdly, the smaller size of the IC-7000 means that heat dissipation is an issue (do a search for IC-7000 reviews and you'll note that heat is most definitely a consideration with that radio). In a portable situation where the rig is likely to be exposed to sunlight or the heat of summer it is desirable for the rig to run as cool as possible.

Don't get me wrong - I like the IC-7000 and plan to purchase one; however, as far as portable operation is concerned I think the FT-897D is a better choice.

Obviously there is some comparison, because he's making one.

> To start with
> the 7000 has a high stability crystal oscillator and DSP based

> portable radios you talked about.

The 897 has DSP filters. It also had mechanical ones available.

> You can get a high stability
> oscillator on the yeasu and 706IIg but it's extra.

It's standard on the 897D

> That's just the
> beginning, the 7000 has a bandscope.

Most say that the 897's bandscope isn't very useful.

> It has 3 stacking registers per

200

> The display has video
> out to remote the display to something larger like a TV.

I've heard that the video out is a lower resolution display of the LCD.
I'm sure that's useful for some.

The 897 has a port for an external meter, such as LDG's FT-Meter that
helps a lot.

> It's
> virtually the same size as the yeasu or at least the 706. (I have a

"Among the advanced features of the FT-897D are many
incorporated only in large base-station transceivers. These
include Dual VFOs; Split-Frequency operation; Digital Signal
Processing (Bandpass Filtering, Noise Reduction, Notch,
and Microphone Equalizer); IF Shift; Clarifier (“R.I.T.”);
IF Noise Blanker; AGC Fast/Slow/Auto/Off selection; RF
Gain and Squelch control; IPO (Intercept Point Optimization)
and a receiver front-end Attenuator; Built-in High Stability
Reference Oscillator;" - From FT-897D operating manual

>
> The Yeasu and 706 are last generation rigs, the 7000 is a state of

Wow! Last Generation! State of the Art! Shouldn't such marketing-type
hype be in quotes?

> I don't know why anyone would steer you to the other two except for
> cost.

I don't know why anyone would take posts like this over reading both of
the manuals to see what features the radio has that is important to
them. Few people, if any, will use all of the features on either radio
very often. What matters is what you think you will need to use.

All of you guys should go to the product reviews at the ARRL website. You may have to do some research to understand what the numbers mean, but once you learn what blocking dynamic range is, you can then compare that parameter on the 2 radios.

These opinions are just that, opinions and mean nothing. Try it, you might like it.

Thanks Brandon,
I think you are absolutely correct.
Ross

Brandon Cruz <cruzb04@...> wrote:
Although I agree with the original author that the IC-7000 is a superior radio in many respects when compared to the FT-897D I think some additional points should be considered. One, with most people cost is a factor. One could purchase an FT-897D and quite a few accessories, antennas, etc. for the cost of an IC-7000. Secondly, I think the one factor that is often overlooked when discussing portability is the power source. Yes, the FT-897D is bigger than the IC-7000 but it has the ability to hold 9 Ah of battery capacity. If you use mobile rig like the '7000 or the '857D for portable operation you must also carry batteries and cabling in addition to the rig. In my mind having to carry a separate power source tends to offset the size issue. Thirdly, the smaller size of the IC-7000 means that heat dissipation is an issue (do a search for IC-7000 reviews and you'll note that heat is most definitely a consideration with that radio). In a portable situation where the rig is likely to be exposed to sunlight or the heat of summer it is desirable for the rig to run as cool as possible.

Don't get me wrong - I like the IC-7000 and plan to purchase one; however, as far as portable operation is concerned I think the FT-897D is a better choice.

Brandon,
If you don't mind, would you tell me what else I have to buy besides the basic 897D rig to use it in my truck and also as a base station. I'm thinking of it as being able to take it from the base station in the house to my truck if and/or when needed.
Thank you for your time and consideration.

TCXO comes standard with the 897D, so that part is wrong.

Look, the big advantage for the 7000 is IF DSP. That is huge.
On the other hand the big drawback to the 7000 is the high current
drain on receive to run that DSP. That is big too. That means that
you have to lug a bigger battery around to make it match the 897D,
so it really isn't nearly as portable is it?

I don't really know which one I want. But I did stick around on this
list and not in the 7000 list.

There's one other factor that hasn't been mentioned, but the SWR meter on the FT-897D works on VHF/UHF as well as HF. The SWR meter on the IC-7000 only works on HF/50. That was the major factor in my going back and getting another FT-897D after I had sold my first one a month earlier to buy an IC-7000.

I have both. I like both.

Well, if opinions that come from owners, especially those that own both rigs in question, aren't any good, why would we take anyone else's opinions. Opinions are opinions aren't they?

Well yeah, that.

On the other hand part of the argument for the 7000 is that you don't have to buy any filters and that is worth a couple hundred which pulls the difference down a bit.

Just don't look back :) It's like most decisions, it's important to make it and move on. I love watching this thread, kinda like watching a train wreck, because it so much mimics astronomy, another hobby where people pay a lot of money to drag all sorts of stuff outdoors in the dark or bad weather to have fun. But they have the "which telescope is better" argument solved. It's the one you will actually get outside with and use. Which seems to be the point here too! Good luck with the 897D. It does more, different things pretty well. 73 Scott

Which is why I never did buy that 897D. I'm building a 16" f/5.7 dob, grinding the mirror and everything. Fun. Ross, there are a number of variables in in the situation you describe but here are a couple of thoughts:

If the rig is going to move back and forth I would purchase a second power cord and run it to the battery in the truck rather than try and use the same power cord for both base and mobile use. That way you could simply unplug the rig from the power supply in the house and then connect it to the power cable in the truck. Alternatively you could purchase the internal AC supply for the '897 and then use the DC power cord in the truck.

One consideration would be safety. I would consider purchasing the mobile mounting bracket so that the '897 can be secured while driving. I've known people that simply put the rig on the seat but that seems dangerous both for the rig and the driver. Of course one disadvantage of the size of the '897 is that it is a bit large to fit under the dash of most vehicles. It also does not have a detachable face (a la the FT-857D or IC-7000) so it is a little less convenient than a true 'mobile' rig. If you find that the rig will be mobile a good bit of the time you might want to consider the FT-857D for that purpose.

Of course the mobile antenna is another issue. There are many, many variations and mounting possibilities for mobile antennas. The least expensive (and probably one of the best performing) is simply a set of Hamsticks. They work quite well. If convenience is desired then perhaps the ATAS-120A should be considered as it works well with the '897/'857. Toward the upper end in terms of both cost and performance would be the screwdriver-type antennas such as a Tarheel. You can also use a remote tuner (FC-40) with a 102" CB-type whip which is a good combination as well. Whatever mobile antenna you choose keep in mind two things - you'll need a mount that's mechanically very sturdy (typical trunk-lip types generally aren't sufficient) and you'll need a good ground. HF mobile antenna performance is greatly affected by the quality of the grounding system.

One other relatively major consideration is the effect of the RF on your vehicle's computerized engine controls. It would be a good idea to consult the manufacturer of your vehicle for their recommendations.

One other option that might be handy for mobile use is the MH-59 remote control mic. Although I don't have one I believe it would be a very handy item for controlling the rig without having to go through as many menus.

I think that's it for now. If I can provide additional info please let me know.

Ross <dzrtram@...> wrote: Brandon,
If you don't mind, would you tell me what else I have to buy besides the basic 897D rig to use it in my truck and also as a base station. I'm thinking of it as being able to take it from the base station in the house to my truck if and/or when needed.
Thank you for your time and consideration.
Ross

Brandon Cruz <cruzb04@...> wrote:
Although I agree with the original author that the IC-7000 is a superior radio in many

respects when compared to the FT-897D I think some additional points should be considered. One, with most people cost is a factor. One could purchase an FT-897D and quite a few accessories, antennas, etc. for the cost of an IC-7000. Secondly, I think the one factor that is often overlooked when discussing portability is the power source. Yes, the FT-897D is bigger than the IC-7000 but it has the ability to hold 9 Ah of battery capacity. If you use mobile rig like the '7000 or the '857D for portable operation you must also carry batteries and cabling in addition to the rig. In my mind having to carry a separate power source tends to offset the size issue. Thirdly, the smaller size of the IC-7000 means that heat dissipation is an issue (do a search for IC-7000 reviews and you'll note that heat is most definitely a consideration with that radio). In a portable situation where the rig is likely to be exposed to sunlight or the heat of summer it is desirable for the rig to run as cool as possible.

Don't get me wrong - I like the IC-7000 and plan to purchase one; however, as far as portable operation is concerned I think the FT-897D is a better choice.

Ross wrote: While comparing which HF rig to buy I got this comparison from an Icom 7000 owner. I thought some of you might be interested, especially about the "last generation statement". I would sure like to hear some responses to the message below:

"There's no comparison between the 7000 and the other radios you're looking at and the 7000 is as portable as they come. To start with the 7000 has a high stability crystal oscillator and DSP based filters. You can't get the DSP based filters on any of the other portable radios you talked about. You can get a high stability oscillator on the yeasu and 706IIg but it's extra. That's just the beginning, the 7000 has a bandscope. It has 3 stacking registers per band (remembers the last three freqs on each band). It has 500 memories, the 706 (and the Yeasu?) has 100. The display has video out to remote the display to something larger like a TV. It's virtually the same size as the yeasu or at least the 706. (I have a friend with the 706 and we've compared them side by side) It has builtin notch filter, automatic and manual noise filters and 2 DSP based filters that are completely adjustable, something you only find on base stations.

The Yeasu and 706 are last generation rigs, the 7000 is a state of the art radio and is just as portable as the other two you mention. I don't know why anyone would steer you to the other two except for cost.

From: ab8jr
Topic: 17412 Message: 17453

Randy,
I couldn't agree more. I feel as though my email's been spammed by this thread. I've owned my 897d for 3 three years. It's been used as a base primarily although it's gone on field Day. It's an excellent radio and my interests are primarily contesting and DX.

Ross,

I see that you appear to be a newly licensed Tech. My suggestion is as follows:

1. Determine what you intend on using the radio for.
2. Find a rig or two that meets those requirements.
3. Find fellow hams who have those radios, sit with them and get some hands on experience.
4. Consider a used rig. Get some indepth experience until you fully understand what features are important to you.
5. Forget the advertising hype.
6. Forget subjective reviews that contain only anecdotal information. Many of these may be from those with little or no more knowledge than you have.
7. As others have said, download the manuals and ARRL reviews and read and study them.

The most important thing is finding a radio that you're comfortable with. This means getting some hands on time. To me that's far more important than a comparison of specs or the opinions of others. It's going to be your radio. This thread seems to be debating the age old question of "How many angels can dance on the head of a pin?". I wish you luck on your decision and hope you have many enjoyable hours on the air.

I don't know if it's just because Yaesu has improved the built in filters over time, improved on other aspects of audio, or people have developed techniques for using them, but I've read several reviews lately that say that the mechanical ones don't offer noticable improvement over the internal ones, especially on SSB. So, while you may add their cost when comparing radios, you may not end up buying them.

I do suggest adding the cost of the MH-59 mic for the comparision.

Oh, and I forgot about the optional MH-59 microphone for the FT-897D, which lets you adjust everything in the radio except the RF gain/squelch. Helpful for mobile operation!

However, the audio readout of the frequency/mode of the IC-7000 isn't a bad feature for mobile operation, either.

Like I said, I have both and like both.

I don't know why this just struck me after having read it several times, but it's very easy to give a comparison of "the best, most needed features."

Both radios have all of them.

There are many ways to use these radios, but for most uses, they both provide everything you need. The additional features are wanted/needed/useful for less common uses, such as backpacking, satellite, heavy duty contesting, QRP, field work, non-ham band listening, frying eggs, ...

Agreed. While I had the Inrad 2.0kHz and 300Hz mechanical filters in my first FT-897D, when I bought the second FT-897D, I felt I didn't really need them. While the adjustable filters in the FT-897D are not as good as those in the IC-7000, they're almost as effective as the mechanical filters, and MUCH more flexible. I occasionally run with lower/upper limits as tight as 400/1800 Hz in the FT-897D, and the flexibility of being able to do that can't be beat (ditto on the IC-7000, of course).

Thanks Dean,
I was just comparing some of the very nice, and helpful, responses to the not-so-helpful. You and the other guys who were so helpful remind me of the old men who used to be more than happy to spend hours talking to new techies and explaining things to them. Then I contrast them with some of today's hams, probably the younger ones, and I wonder how the hobby will survive the new tech age with some of their attitudes. I do appreciate the more mature and considerate help. Thank you, and the others, very much. You've been a big help. I have not got my membership to ARRL yet. It will be a while, so I can't read the reviews on the site. We also don't have a very helpful person at our local HRO. He's kind of like a few of the guys on here who think discussing good and bad points of radios is "spamming".

From: Ross
Topic: 17412 Message: 17460

Very good point Randy.
Ross

Randy Charles Ford <kg4jix@...> wrote:
I don't know why this just struck me after having read it several times, but it's very easy to give a comparison of "the best, most needed features."

Both radios have all of them.

There are many ways to use these radios, but for most uses, they both provide everything you need. The additional features are wanted/needed/useful for less common uses, such as backpacking, satellite, heavy duty contesting, QRP, field work, non-ham band listening, frying eggs, ...

17461. Re: [FT897] This might be of some interest to 897D owners.

Yahoo group: FT897 (2007)
Date: 2007-02-21 06:44:50 UTC
From: Randy Charles Ford
Topic: 17436 Message: 17461

Is there a category for not-as-nice but helpful responses?

The "spamming" concern is because most of this is re-hashing of what's in the archives. There's a big difference between a specific questions about the radios and a general "which is better?" or "compare these two for me."

You posted a link to Dean Gibson's (AE7Q) comparison of the radios. That comparison is the best that I've seen and it help me lean toward getting the FT-897. Of course, if you had typed IC-7000 into the search on the archives of this group, you would have found the full text in Message #15713, posted Sept 27, 2006.

There are 5749 members of this group. There are probably very few who have not compared the FT-897D with the IC-7000. Most of them also are probably tired of wading through this type of message to find ones that concern them.

Jim (AB8JR), who used the "spammed" word, went on to give you good advice on how to reach a decision. I consider that to be helpful. In fact, I don't recall a single post in this discussion that was not intended to help you. Is the teacher being not very nice who is teaching to fish instead of giving a fish? Some of us see advice such as "read the manuals", "read the archives", and "decide how you would use it" as being very helpful. Maybe the person at HRO is trying to get you to make an intelligent, informed decision instead of just pushing the one he makes the most commission on, or that gets you out of his door the quickest. This is a complex personal decision; I would question the motives or abilities of anybody who tries to make the choice for you. (I don't believe anybody on this list has done that.)

While you may or may not consider my posts to be helpful, I have personally put a lot of effort into trying to help you make your decision, and I don't regret that at all.

From: jon_knodel
Topic: 17408 Message: 17462

Do what I did....BUY BOTH!!

I had the same dilemma about a month and a half ago. I couldn't decide which one to get...both were great for different reasons. So I just said to heck with it and bought both of them. I love them both for their different features.

I have the Yaesu FT-897 and love it. I use it as my main station.I
went with the 897 because of its size. Its works great At home, in
the RV and cabin. All have different antenna systems and all get good
signal reports.

Are you trying to receive or transmit?

This is covered in the manual in more detail but you have to change the digital mode to USB pesky.

Also you will have to have PSK software I like the software that comes with Ham Radio deluxe. If your looking to transmit you have several different operations. I would recommend getting receive to work correctly first.

From: James Wilson
Topic: 17465 Message: 17470

I purchased one of these which has yet to arrive.
http://www.tigertronics.com/slusbmain.htm This greatly simplifies the process.

You will need to install a cable between the headphone jack of your sound card to the data port on the back of the ft-897 and it will need to have resistors installed to reduce the signal strength. If your more adventurous it can be plugged into the mic port. Then enable the digital vox page 58 of the ft897D manual menu item 40. Page 41 talks about psk settings.

With the Signalink you don't have to enable the digital vox because the device has a vox circuit built in.

Hope this helps.

The directions may not visible at the bottom of each email. I don't see them. I'm not sure if there is a profile preference for plain text messages, but if so I probably have it set to plain text. I don't see the instructions. I do see them on replies that are posted from people who do not remove unnecessary junk from the bottom of posts.

BTW, even though I get plain text, I also get it as a html attachment with group info that includes a link for unsubscribe, but not how to do it via email. It looks similar to the groups web page on yahoo.

Here appears to be what people are referring to as being at the end of every message, but isn't on the ones I receive:

17477. Re: PSK operation

Yahoo group: FT897 (2007)
Date: 2007-02-22 02:00:13 UTC
From: k8ysv
Topic: 17465 Message: 17477

Hi John,

No special config needed in the radio. I run mine in "DIG" mode and it works great! I've experimented with several different interfaceds and several different programs. The ones I've settled on are the WMR Rigblaster NoMic and WinPSKse. There's a promising new PSK app in development by the gentlemen who gave us Ham Radio Deluxe that I will definitely try though.

For info on how to interface the FT-897 to the Rigblaster NoMic specifically, check the files section of this group Here:
http://f1.grp.yahoofs.com/v1/EOvcRdK2GccgZyXtPSE0T64W-1BeQBK9J7RtdtV908g8JKlW39u-xHJdStRW2nd93QjNZSETuAIoByFWN59DITUpqA/897nomic.zip
for a write-up I've...well...written up (also available at the WMR website). What's different about this method is that I've left the audio coming out of the rig's speaker untouched and you can either listen to the audio or mute it out completely with the volume control and not affect the PSK at all.

I can't speak for all interfaces, but they're generally pretty similar, so the connections you see there should be adaptable in concept to whatever interface you end up with.

73,

Jeff K8YSV

Try the Deltran Battery Tender. My favorite is the Waterproof 800 USA Battery Charger but I use the Battery Tender Plus also. I have three of these tenders, one on my motorcycle, one on my 115 Ah earthquake battery, and one on my camping trailer where I try to run everything on 12V. You will never overcharge your battery. The Plus model will charge at up to 1.25A, the waterproof 800 will charge at up to 800 mA.

Hi all,

I need to get my FT897D repaired (Audio out not functional from the headphone socket following a problem with laptop audio interface).

The rig is well out of warranty and it was bought 2nd hand in USA a couple of years ago.

Where can I get this repaired in UK?

17484. Re: Has any one used this radio as a Base station only ???

Yahoo group: FT897 (2007)
Date: 2007-02-23 10:36:47 UTC
From: pa3akf
Topic: 17413 Message: 17484

Ozzie,

For abt 20 years I had a kenwood TS 930 S as a base station only. At the end of 2001 I exchanged that one and bought a FT 817 and after two years the horrible sound and lack of pwr made me buy a FT897 at the beginning of January 2004. I am very happy with the FT 897 specially in combination with a PC and Ham Radio de Luxe which makes manual tuning with a MFJ-945E, a Fritzel balun and a double zepp dipole (20 meters long and 12,95 symmetric feedline) very easy on HF. Even on VHF I can spot some activity with a simple Diamond "screw on" antenna.
The latest thing is that I can plot ships in my neighbourhood on my computerscreen with AIS from the signals I pick up with the FT 897 on VHF Marineband and the program Shipplotter.
So the rig is versatile enough for me. The sound is even better with a cheap speaker in a homemade wooden cabinet connected to the FT 897. A home-adapted old mA-meter serves as a analogue S-meter.
The advantage of a non D-model is that you can easily wideband it with Widebandersoftware. Since in the Netherlands the 40m hamband was extended last year, it was very easy for me to make the rig transmit in that new section.
Of course it depends on what you like to do with hamradio but for me its more than enough.

73 de Karel, PA3AKF.

Paul,

Last-first. I actually use an ICOM AH-4 with my 897. I had access to the control head from an AH-2 and it works just grand for me. Two more steps to tune the radio and that kept the other jacks free to do data and rig control.

As Ed McMahon would say, "Everything you need to know about the Ham Radio Deluxe DLL to use MMsoft programs is contained right here!" http://mmhamsoft.amateur-radio.ca/HRDPTT/index.htm

I haven't sent SSTV with this (receives well), but have no doubt it would work. RTTY is seamless once the DLL is installed.

Ozzie,

I have used a 897D since 2004.
I am more then satisfied with it as base station, especialy after I built small MIC port interface board.

Now I have second CAT, PTT footswitch and standard PC headset connect to 897 also.

In April, QST will publish my article about interface board and I hope lot of 897 owners will build it to improve 897's capability for base station operation.

17491. Automatic Repeater Shift on 70cm

Yahoo group: FT897 (2007)
Date: 2007-02-24 14:36:02 UTC
From: John S. Gaythorpe
Topic: 17491 Message: 17491

Another oddity on my FT-897D. When on Simplex in 70cm, I noticed that the FT-897D was doing a 5Mhz shift. Whoa! Okay so I turn option item 76 off. Still does it. I had to set option 3 off to stop it. I don't have this problem on 2m Simplex.

Why would this occur on 70cm and not on 2m in Simplex?

John.

17492. PC headset connection

Yahoo group: FT897 (2007)
Date: 2007-02-24 19:36:07 UTC
From: Nenad R
Topic: 17413 Message: 17492

Hello Jean-Chris,

PC headset has electret microphone and need voltage present on mic line. You can connect 2,2k resistor between +5V and mic line of headset. To not bring voltage to 897 mic input put in serial one 10uF electrolitic capacitor.

I am very sorry but for MIC port interface schematic and PCB designe you should wait April number of QST.

Hope this mail help you.

That is all I have ever used it for. I have a Dentron MLA-2500 and an Alpha-Delta Dipole for 40-160 meters. For 10, 12, 17 meters I use a IMAX 2000 with really good results. I also have a homebrew 20/40 dipole. I built the samll box to tune the radio with the ACC. jack. It;s a must if you use and amp. I have the AT-897 Tuner and I also have a LDG AT-1000 autotuner. This makes life so easy :) On 6 meters I use a Par OA-50.

I'm not sure what you believe the problem to be. The 897 is set at the factory to believe that certain portions of the 70cm band, like the 2m band, are reserved for repeater use, and the standard repeater shift on 70cm is 5MHz. There's a chart in the manual; in my version it's at the bottom right corner of page 34. You may disagree about the status of a certain frequency because it may not agree with the band plan you're using, but overall I find the repeater shift and direction to be correct on 70cm. You can always turn the shift off for a given frequency if you want to work simplex there.

Here in northern California our 70cm band plan agrees with the 897's, but Icom publishes a US band plan that shows repeater use only between 442 and 445 and between 447 and 450, with simplex between 445 and 447. If you're following that band plan you will have to override the 897 settings.

17496. RE: [FT897] Ft-897D and MH-59 DTMF tones

Yahoo group: FT897 (2007)

From: John S. Gaythorpe
Topic: 17396 Message: 17496

Thank you for all your suggestions on this problem!

Even tried the modifying the settings in the alignment menu!

I am definitely leaning toward the "temperament" factor of the receiving equipment. Although I do suspect the FT-897D tones generated by the MH-59 mike are not "true tone" and I cannot verify that without some test equipment to find the actual amplitude of the 2 superimposed tones generated by each key.

What I have discovered is that sometimes a node will pick up some of the tones, but not accurately and not all the time. While a FT-7800 on top of the FT-897D will hit the same node with the correct tones almost all of the time.

Upshot: I will continue to play with the mic settings, meager as they are and wait until I can find a scope and time to definitely map each tone as opposed to the FT-7800 that is working.

From: kd4e
Topic: 17413 Message: 17500

My FT-897D is my main base rig.

I chose it over a 857D because I prefer the control
layout, slightly more traditional with a couple fewer
layers of menus for frequent actions.

It is a very good rig for its price class and better
than most because in addition to being a solid base
rig it is also an excellent mobile/portable rig.

17501. Yaesu MH-59 -- Is control via dtmf tones?

Yahoo group: FT897 (2007)
Date: 2007-02-18 21:25:36 UTC
From: kd4e
Topic: 17501 Message: 17501

Are the control features of the Yaesu MH-59
via dtmf tones?

I am looking into the possibility of controlling
my FT-897D via a MH-59 connected to a 440 rig and
am wondering:

a. Can the control signals be captured and sent
via a HT?

b. What needs to be in the MH59->interfacebox->HT?

17502. FT-897 or 857 Radio Remote Control HamGyver?

Yahoo group: FT897 (2007)
Date: 2007-02-12 22:54:45 UTC
From: kd4e
Topic: 17502 Message: 17502

Just came upon this fascinating little device:
http://www.mfjenterprises.com/products.php?prodid=MFJ-664

Does the MH-59 remote control mic use tones that
could be passed through a device like this?

I am thinking that one tie a MH-59 to a 440 HT,
send sigs to a FT-897/857 with a MFJ-664 attached
which would then store and forward the control
tones to the FT-897/857.

If this would not work how about a separate 440 HT
tied to the MFJ-664 and then the MFJ-664 output is
sent to the FT-897/857 for remote control?

WDYT?

I believe that they were mounted inside the
mic head at the base where the mic cord enters
the mic head.

My FT-897D came with the MH-31 mic.

Do you recall if you mic has a DTMF pad? If so
it is probably the MH-59, if not then the problem
is likely not in the mic.

17505. Cooling a FT-857 or 897 in an Aluminum Box

Yahoo group: FT897 (2007)
Date: 2007-02-24 21:03:54 UTC
From: kd4e
Topic: 17505 Message: 17505

I am setting up a portable station. It will be
contained in two top-opening aluminum cases.

I am concerned about the trapped heat since the
heat sinks of various devices will be toward the
bottom of the boxes.

The rigs would not be operated unless the top of
the box is opened. Would a single 12vdc computer-type
fan toward the top of the box create adequate negative
pressure?

Last week, I found my new 897D had the "Noise on 6 metres on SSB"
problem. I phoned Yaesu UK technical support, and they said the problem
had to be handled by sending it back to the dealer for warranty repair.
So I sent it back to the dealer and they have sent it back to Yaesu.

If yours is out of warranty, then I would suggest Adur Communications
in West Sussex is excellent (www.adurcomms.com), if your qth is in the
south of England. They have done several
repairs on other radios for me.

Hello Hosmer,

At my school radio club, we use the FT-897D with a small Samlex SEC 1223 power supply, and the combo works great. The receiver is very good, and it's easy to move from HF to VHF. Also, the rig has been operated with the built-in batteries, and it is a very slick, portable/emergency package.

A small rig like this certainly presents compromises and limitations, but that must be considered before purchasing the transceiver. However, I think it's amazingly versatile. For me, the most important accessories would be the 500 Hz cw filter, a pair of good headphones or an outboard speaker.

BTW, we have run the rig with a small linear and it keyed the amp from the CAT port.

Good luck!
KC7LHG School crew

Just like to 2nd the idea. The 897D great all around base and portable rig if needed. I have the Collins 2.3 filter and the add on LDG electronics annlog metre and the Yaesu Dynamic Desk MD- 100 microphone. I got the internal power supply from Hamcity however sent it back as I have Alinco DM 330MV power supply which does the job.
I have had 897D for about year a great radio and use as my base and portalbe.
Gerald
VA3GAK

thb201 <hudakjm@...> wrote:
Yes. Since I got it last year it's been the only way I've used it. However before purchasing it I borrowed a friend's FT-897 and took it on a trip to see how it worked out. At home I also have as my only other rig a Yaesu FT-840, which is more or less in the same price range as the FT-897D. If I had to pick between the two for HF I would go for the FT-840 (now discontinued). For me the FT-840 is more ergonomically friendly. No menus, and the buttons, knobs and switches are single funtion. I also just like the sound of my FT-840's receive audio better (yes I compared using an identical external speaker). The FT-897D is just a more "fiddley" radio. However if you factor in that the FT-897D has 6m, 2m and 70cm then there is no contest. That is why I bought the FT-897D, to get a reasonably powered, all mode HF/VHF/UHF rig. I've got a hankering to get onto 6m. Plus I can take it on trips. I'm thinking about getting the internal switching power supply though because when I borrowed my friend's rig I didn't like the idea of having to drag along a separate power supply. My trips are not camping trips so having AC power available is not a concern.

If I had to have only one rig, wanted a base station with portability and VHF/UHF all mode capability then I think the FT-897D serves the purpose quite nicely. Even if I didn't figure in the portability factor I still think it makes a good (not perfect) all around base station rig.

Topic: 17436 Message: 17511

Hello,

First of all, I would like to thank all the people who send a comment to my question concerning the Yaesu FT-897D.
In the meantime, I bought one at an Hamfest this sunday. A new one with a serial saying that it was manufactured in JAnuary 2007. High stability TCXO is standard as well as dsp and all the dsp goodies. It has 200 memories, I am still discovering the rig but I made already some qso and I can tell you it is fantastic and my reports were outstanding. There is also a possibility to adjust the sent audio band pass by the way of an audio equalizer.The maximum band pass in reception is from 100 Hz to 6000 Hz with two dsp adjustable filter to reduce this band pass on the two sides.
Up till now, I am amazed by the possibilities of this small rig compared to the bargain price I paid for it (730 euros, about 800 dollars).
Dont hesitate one second at that price level to buy one, its worth for the money.

Of course, the ICOM 7000 is a new generation rig and I am dreaming to it, but it is twice the price of the Yaesu FT897D, so....for me the picture is very clear ! I have a lot of base rigs, starting from DrakeTR4, TS820S, TS830S, FT902DM, FT1000D (the Best), Kenwood TS970S (excellent with is DS¨P), etc...
My FT897D is intended to be used during picnic, barbecues or "DX spedition" somewhere in my country during the week-end (HI 3x). But for now I am discovering this small gem by using it as base station in my shack and it do quite a nice job and is giving me a lot of fun.

Thanks again to everybody sending me advise and comments.

For all the others still hesitating, buy one, t will give you a lot of pleasure....and if you can afford a more expansive model, dont hesitate either, they are all very good !

Best 73 from Patrick - ON4NY

Subject: [FT897] This might be of some interest to 897D owners.

While comparing which HF rig to buy I got this comparison from an
Icom 7000 owner. I thought some of you might be interested,
especially about the "last generation statement". I would sure like
to hear some responses to the message below:

"There's no comparison between the 7000 and the other radios you're
looking at and the 7000 is as portable as they come. To start with
the 7000 has a high stability crystal oscillator and DSP based
filters. You can't get the DSP based filters on any of the other
portable radios you talked about. You can get a high stability
oscillator on the yeasu and 706IIg but it's extra. That's just the

beginning, the 7000 has a bandscope. It has 3 stacking registers per band (remembers the last three freqs on each band). It has 500 memories, the 706 (and the Yeasu?) has 100. The display has video out to remote the display to something larger like a TV. It's virtually the same size as the yeasu or at least the 706. (I have a friend with the 706 and we've compared them side by side) It has builtin notch filter, automatic and manual noise filters and 2 DSP based filters that are completely adjustable, something you only find on base stations.

The Yeasu and 706 are last generation rigs, the 7000 is a state of the art radio and is just as portable as the other two you mention. I don't know why anyone would steer you to the other two except for cost.

A couple months ago there was a post by a gentleman that was asking about if anyone had ever fit an LDG Z-100 autotuner inside of the FT-897. I don't think that he ever got much of a response...but it ate at me. Well, I have gone and done it. My end result is a 100% internal and fully functioning system. In fact I have noticed that I can tune up in odd places that I was never able to before with the exact same tuner. For example: I have a (sic) "fan dipole" in my attic that has 20M, 17M, and 10M elements. Before, I could tune it in the upper portion of the 40M band (sometimes). Now it tunes without a hitch all the way down to 80M on the same crappy antenna (now efficiency is another issue). I am attributing this to the new metal housing (the battery compartment of the 897) that is providing a much better ground than the unit had before (Z-100 has a plastic casing, normaly). I'll post to the photos section soon and give a little detail of the project. All I can say is this is the coolest FT-897 on the block!

17521. FT-897 data jack.

Yahoo group: FT897 (2007)
Date: 2007-02-25 16:18:39 UTC
From: skrnjeta
Topic: 17507 Message: 17521

I am using FT-897 for 4 years on standard mode (SSB&CW) Few weeks I try to work RTTY and PSK31 using Data jack on rear side and simply interface to sound card on PC with Win mix software.I can not get audio signal on data jack for decoding even in Dig mode or any other.Dose any one have some advice how to obtain that.
Much obliged 73 Boban 9A2LX

Phil:

I purchased a Black and Decker "Smart" charger at Walmart for under $20. It will charge at either 1 or 2 amps and is specifically designed to keep a float charge auto batteries.

Personally, I use it to charge my gel-cell batteries.

BILL I HAVE A COUPLE OF FT897D AND USE THE AT100PRO ON BOTH OF THEM. WHILE THE FT897 TUNER IS OK THE AT100 PRO HAS A MUCH MUCH LARGER MATCHING RANGE. I HAVE NOT HAD ANY TROUBLE WITH THE 100PROS ON ANY ANTENNA INCLUDING LONGWIRES, DIPOLES AND VERTICALS, HOWEVER THE LONG WIRE NEEDS THE 1 TO 1 BALUN LDG SELLS FOR $30.00. GOOD LUCK DENNIS W5VAF

From: Ken Bandy
Topic: 11123 Message: 17525

Hi Bill. The two main advantages of the AT-897 over the AT-100 Pro are the AT-897 will "bolt-on" to the side of the radio, so it's one packaage, and the fact that the AT-897 is powered via the CAT plug on the back of the FT897. Good thing is that that there is a second CAT receptacle on the AT-897, so you can still use the CAT for what ever you want. One down side of the AT-897 is it's documented problems with 6 meters. Even though it says it will tune that band, it tends to attenuate 6 meters a bit.

I have both tuners, having just recently replaced the AT-897 with the AT-100 Pro on my FT-897D at home. I'll probably end up putting the AT-897 on the FT-897 (non-D) that I recently bought used for work, once I get an HF antenna up.

73,
Ken

Yup, there are a lot of things out there that call themselves float chargers. The only one I've looked at did not have a float voltage of 13.2 volts. However, whatever you are using, don't be concerned about rate of charge but the voltage. With the correct voltage, the charging rate will take care of it self. For best life float at 13.2 volts. All the battery manufactures, who manufacture batteries for battery backup as well as deep cycle batteries, recommend 13.2 volts.

The whole idea with floating a battery is to have it in parallel with your power supply and when there's a power interruption the battery becomes the source without a break, as there would be with a relay. With a power supply set at 13.2 volts, the radio will run fine and the battery can sit there a long time.

KD4E:
The Astron battery backup modifications are not exactly trivial. It's best to order the supply with it built in if possible. I did order a battery backup kit for an RS-50M, but it wasn't a plug and play installation. Works fine though.
One word of caution regarding the Astron linear power supplies is that with at least some of their models you can destroy the regulator chip by having voltage applied to the output while the supply is off (like simply putting a 12V battery across the output).
Also note that you can use battery isolators and such on the output of a supply to have immediate switchover to a battery, but you have be aware of the charge current for a depleated battery when the power comes back on to make sure it doesn't overload the supply.
Needless to say, it's important to consider all of the possible scenarios when setting up a backup battery.

Hello Bill

A small homebrew interface and Ham Radio Deluxe should do the trick.
http://hrd.ham-radio.ch/
A few junkbox parts and excellent free software is always a winning combination.
You can find an example interface on my page.

Well the battery back up mod for the astron is the only one approved for the astron by the coast guard so I figure it is good enough for me to use. And you can find it by doing a Google search and it is a lot cheaper than the astron version.

David:
I can't seem to find a mod associated with the "Coast Guard" but did
find one on a USAF site. Is this the mod you're talking about?

https://ntc.cap.af.mil/RS_Battmod.cfm

This mod puts a 10K resistor between the wiper of the voltage sense pot
and the regulator. My guess is that this is to avoid the damage I referred
to. However, this mod is deficient in two respects.
One problem is that it does not protect the supply or wiring in the
event that the crowbar SCR is triggered (for whatever reason). Since those
SCR's are rated up around 200 Amps, such a fault could cause some cable to
disappear. One would hope that there's a fuse on the battery to prevent
this. This can be avoided using a series rectifier between the output of
the supply and the battery. Of course that would have to be able to handle
to full load of the supply, so it probably needs to be on a heat sink. The
supply also then needs to be adjusted to properly float the battery with
the extra voltage drop.
The other problem is charge surge when power is restored. Any decent
sized battery will draw a significant amount of current at the voltage set
for floating the battery when the battery charge has been depleted much
from a full charge. This could easily be enough to overload the supply. As
such, there really needs to be some kind of current suppression for that
situation.
While there is a note in the mod regarding a fuse on the battery in the
event the crowbar triggers, that a rather brute force solution and doesn't
fully address these concerns. So, if this is the cheaper mod you're
talking about, the Astron version is probably worth the added expense.

Yep first time I found it back a few years ago the coast guard had there emblem on that page too but that is the mod. I have done it to every astron I have and every astron has survived every power outage with out a problem did I mention I own 5 astrons and at one time had 6 but I sold one to a fellow ham. The other thing about doing this mod you can buy a smaller supply and keep a bigger battery fully charged cause in the time your rig is off the battery will charge and if the astron you buy is big enough o supply more voltage than the radio needs when listening then it will charge the battery that way too well have fun and keep them the battery charge

Any decent sized battery will draw a significant amount of current at the voltage set for floating the battery when the battery charge has been depleted much from a full charge. This could easily be enough to overload the supply. As such, there really needs to be some kind of current suppression for that situation.
While there is a note in the mod regarding a fuse on the battery in the event the crowbar triggers, that a rather brute force solution and doesn't fully address these concerns. So, if this is the cheaper mod you're talking about, the Astron version is probably worth the added expense.

17538. Re: This might be of some interest to 897D owners.

Yahoo group: FT897 (2007)
Date: 2007-02-26 01:13:01 UTC
From: Ross
Topic: 17436 Message: 17538

I have been discussing the advantages of the Icom 7000(which the local HRO is trying to push me towards) vs. the 897D. After reading all the reviews and all the posts here and elsewhere I'm beginning to understand the merits of the 897D. I would like to get some of your recommendations from hands-on experience on things like antennas,both mobile and base, tuner, power supply, batteries, and whatever else I need to make an 897D easily portable, as you said in your post, to take on picnics, camping trips, whatever.... I basically know what's available, but I'm wondering if there is a consensus here on this site as to the best products for each item I am going to need. I realize this is a lot to ask, but I've read many opinions, now I'm wondering if y'all have somewhat of an agreement on these items since you are the experienced people.
Thank you for your help.
Ross

Ross,

I have two 897's (non-D)....with the following accessories...

FC-30 antenna tuners on each...I know what the reviews say....but in my set up...works fine...
MH-36 DTMFmics
Internal batteries/only 20 watts
Heil headsets
20 meter end fed Par antenna
17 meter end fed Par antenna
20/40 dipole
Buddipole antenna...(only one right now)

Deep cycle marine batteries for both.
Various hard side cases to carry each in.
Laptop computer

I use these portable and base only...have a TS480 for mobile

My advise is to buy one of the accessories, try it....keep it if you like it or sell it if you don't....

Fritz

Ross:
Hope your decision-making process is progressing well. I've been following your messages and responses since we exchanged E-Mail a bit ago and it looks like you're getting the full spectrum in the replies.
As I believe I told you, I have the IC-7000 in my car and really like it. If it was simply a decision as to what to put in a mobile, I don't think the 897D would be in the running. On the other hand, for portable operations, I'm pretty stuck on the 897D.
I don't know if I mentioned the way my 897 is packed most of the time. I have a computer Targus computer case like the following.

http://www.targus.com/us/product_details.asp?sku=CPT400

The divider where the computer normally goes is attached with Velcro and can be adjusted laterally. I've moved that to the middle so the 897D fits on the left and the FC-40 fits on the right. I keeps the mics and small accessories in the inside pouches. All the power cords, antenna cables, tuner cable, etc. go in the pouch in front and the charger and supply in the front flap pocket while all the documentation, notepads, emergency references, some small VHF/UHF antennas and such in the file section in the back. Everything I need for a fun day at a picnic table, including a wire antenna, can be slung over my shoulder and carried out on a whim. That and a pack lunch and I'm good to go. (I'll have to take some pictures of all this -- but with my daughter in them and not my ugly face.)
With the above I'm all set to run 20W pretty much all day, assuming the batteries are charged. One of the power cords I carry in the front pouch has two large alligator clips for connecting to the car battery or my 20 AH lug-along battery if I want to run 100W. If I want to get fancy and have to answer a lot more questions, I pack along the Buddypole (http://www.buddipole.com/) and spend most of the day trying to decide which of the 5,000 different configurations I want to use for the Buddypole. If I really want questions, I drag out the AS-2259 (http://www.co.missoula.mt.us/acs/antennas/AS-2259%20antenna.htm) and work NVIS. Does any of this sound interesting?
The other side of this equation is that I can walk in to just about any emergency situation and get up and operating in minutes with what I have or connect to their antennas and supplies (we all do use PowerPoles, right?). If I need digital, it's just a matter of bringing my little Vaio computer (another, much smaller pack slung over my shoulder) or one of our older Toughbooks we setup for our emergency communications group. One more cable and start up some software and I'm running.
So, rather than give you the technical facts, I thought you'd appreciate the mental image. I've had 2 FT-817's and really enjoyed them, but the 897D is just the right amount more of a radio. I've had real mil radios and lugged them around in a backpack and really enjoyed them also, but

they're nowhere near as flexible as most Ham radios. So, I have the 897D now and will likely keep that till something better comes out.
Again, good luck on your decision Ross.

Subject: [FT897] PC interface question

Howdy, just joined the group a few days ago Reason being I'm interested in the FT-897D as a base unit at home and in the motorhome. I've had a Yaesu FT-1000D for many years and Kenwood TS-690s as a backup. I've spent very little time on the radio in the last few years. I'm tired of moving heavy radios to clean around them. Sold my amp last week and the Kenwood is on ebay now. I know I won't be happy not having a radio. The 897D looks good to me and the reviews are good, but I dislike the menu systems on these smaller units. So the question is do any of you use such radio control programs as the Kingsmith Software or any of the others to ease the use of the menu?? If so which program do you like and why?? The Kingsmith has an interesting look to it and fills nearly the upper half of the computer screen making it easy to see and use the buttons.

Does any of this interest me? Is a child interested in ice cream?
LOL.

You're hitting at just what I need to know. I am so torn between
the 7000 and the 897D it almost hurts. The portability of the 897
intrigues me, but I don't know how much I will need portability.
The Icom interests me because of its size and what it will do, and
because it is so downright pretty. It doesn't intereste me (yeah,
right)because of the price.

Anyway, I am very much interested in the way you set up your 897. I
will check out the links after I write this and study the options
open to me.

My last post was written because I'm having people tell me the
portability is no good with batteries because the batteries go dead
very quickly. That bothers me, if it's true. I also read
disagreements about the Yaesud tuner not being as good as some
others, and I would like to know the truth from actual users, not
sales people. I also need an education on base station antennas on
my house, and NIVS antennas, which is what the portability will most
likely be used for, and so forth. We are "blessed" with a very curt
store manager here who doesn't like to answer many questions, and
the one good clerk he had quit. I'm not sure how much I can trust
them anyay. All stores like to sell what they have in stock.

One day I suppose I'll have both the 897 and the 7000, but not soon.

I'll let you know what I finally get. I have the money for the 897
now, but not the tuner, antenna, and whatever.....

Thanks for your patience. Seems like you know what it is like to be
a beginner.

Back to you soon.
Ross

Ross,

I have two 897's (non-D)....with the following accessories...

FC-30 antenna tuners on each...I know what the reviews say....but in my set up...works fine...
MH-36 DTMFmics
Internal batteries/only 20 watts
Heil headsets
20 meter end fed Par antenna
17 meter end fed Par antenna
20/40 dipole
Buddipole antenna...(only one right now)

Deep cycle marine batteries for both.
Various hard side cases to carry each in.
Laptop computer

I use these portable and base only...have a TS480 for mobile

My advise is to buy one of the accessories, try it....keep it if you like it or sell it if you don't....

Subject: [FT897] Re: This might be of some interest to 897D owners.

snip....

I would like to get some of
your recommendations from hands-on experience on things like
antennas,both mobile and base, tuner, power supply, batteries, and
whatever else I need to make an 897D easily portable, as you said in
your post, to take on picnics, camping trips, whatever.... I
basically know what's available, but I'm wondering if there is a
consensus here on this site as to the best products for each item I
am going to need. I realize this is a lot to ask, but I've read

many opinions, now I'm wondering if y'all have somewhat of an
agreement on these items since you are the experienced people.
Thank you for your help.
Ross

Charles I download the 2.0.1 version. It installed fine and seems to work ok. I did drop them a note to see if it will be updated. Will let you know what I hear back.

Ross:
Regarding the batteries, they're 4500 mAH each. That's a total of 9AH. The radio does standby at about 600 mA, something just under 1A receive (depending on audio level), and up to 22A at 100W transmit. Not sure what it is at 20W, but it's considerably less. Since the 600 mA is a bit above the typical 20 hour rate use to rate batteries (the 20 hour rate would be 450 mA) it should easily get 10 hours or more on standby. I can confirm this since I've sat here all day listening to stuff on the radio and can tell you I've easily gone 8 hours with 100% receive time. Of course transmit time will have a big impact on the batteries. While I haven't actually run tests on battery life with any specific TX duty cycle, I'd think that you could run at least a couple hours under normal HF operations. It seem that I generally get a good bit more than that, but perhaps I just don't talk as much as some. Hope that gives you some idea of what to expect with the internal batteries.
I would agree that the FC-30 may not be a good selection for a tuner. It's only designed to match up to a 3:1 load. The LDG AT-897 is rated as 6 to 800 Ohms or up to about a 10:1 SWR. The FC-40, which is larger and has larger components (better efficiency perhaps) is rated at 16.5 to 150 Ohms, which I find interesting since I know first hand that it can tuned just about anything. It is larger, but functions flawlessly and I've used mine on everything from a whip to a long-wire. Of course the real difference is that the FC-30/AT-897 tuners are designed to mount on the radio. I don't know all the implications of remoting them, but I suppose it could be done with the right cabling. Of course the FC-40 is designed to be right at the antenna, which is a big plus for non-resonant antennas.
Good luck on the antenna selection. That's a whole other discussion. You have to decide what you want and what restrictions you have on space and placement, from that the decisions will be a lot easier.

Great program...BUT?...Could you enlarge the font of the freq readout in the upper right hand corner and the band font in the upper left hand corner?...It wouldn't hurt to be 3 or 4 times as big...Thanks for the effort that went into this very helpful program...

Yes. That will be adequate. Remember, your desktop PC is pulling between 200 and 400 watts and the fan is adequate for that amount. Just make sure your air flow actually passes over the unit and you will be fine. I put a fan on my dad's enclosure that I built for him that contains all his HF stuff. He has had no problems.

I owned an earlier 897-D and I widebanded the rig with software and it worked a treat on 5MHz.

Later versions can be modded but I think it's a jumper job.

Try widebander first before getting your iron out.

For dedicated use on VHF/UHF the 897 isn't going to compare that well as a rig that specializes
there. Full dual receive, cross band repeat etc. are just a couple of examples. If you don't
have HF privileges and don't intend to upgrade then the 897 doesn't make a lot of sense.

What VHF/UHF Multimode rigs are being produced? The only one that I know of is the ICOM IC910H. I've not looked too closely at it because it's half again as much as the FT-897D, and twice as much as the FT-857D.

17571. Band data

Yahoo group: FT897 (2007)
Date: 2007-02-28 01:35:33 UTC
From: Larry Molitor
Topic: 17571 Message: 17571

Can anyone point me to a source of information which
will provide details of the band data output on the
CAT/Linear jack?

I've searched the FT-897D owners manual and the FT-897
service manual and have not found anything useful.

I need to know how the bands/frequencies are mapped to
the four data bits.

Thanks,

Larry - W7IUV

Hi Larry,
In the files section of the FT897-group you find the file "CAT - ACC connector FT897.xls".
I hope this will give the information you need.

Hi All,

I am contemplating the purchase of the FC 40 ATU and was wondering if

it will work on a widebanded 897/857 on the 5Mhz band?

What are people's experiences/opinions of this tuner?

My intention is to use it for holiday/portable work with a long wire
antenna strung up to the nearest high point, is this the unit I require?

Thanks in advance for all replies.

If you mean FT-897 and FT-897D (I transpose numbers, too. Really a pain in the checkbook, hi hi.) Main differences are the "D" has TXCO and the US 60 meter "channels" programmed in. Also, the firmware on the "D" (except for maybe some early ones) was changed to not enable software based widebanding.

Actually, Lead Acid GelCells are designed to float at 13.8 Volts, but never above 14.1 volts. That's how computer UPS's work.

See my article in the October 2004 QST "Hints and Kinks" or reference the books "Emergency Power" by Bryce or "Managing 12 Volts".

17580. Need Information on how to use Dual VFOs / Split Frequency

Yahoo group: FT897 (2007)
Date: 2007-02-28 23:12:25 UTC
From: mrmsudawgs
Topic: 17580 Message: 17580

I've owned my FT-897D since January 2007. I have yet to use the Dual VFO feature. My questions are as follows:

(1) How do you use Dual VFOs if the radio is not dual receive?

(2) Is split frequency the same as dual vfo?

(3) Can someone please provide an example of how to use Dual VFOs and / or spit frequency?

Thanks,

Mike

17581. Re: [FT897] Need Information on how to use Dual VFOs / Split Frequency

Yahoo group: FT897 (2007)
Date: 2007-03-01 00:16:29 UTC
From: Brandon Cruz
Topic: 17580 Message: 17581

The dual VFOs have two purposes. One is to allow quick QSY (e. g. having VFO A on 80m and VFO B on 10m and jumping between them). I often have VFO A on HF and VFO B on VHF. That way I can jump quickly between those two ranges. The second purpose is to allow split frequency operation (transmitting on one frequency and receiving on another). DX stations often operate in split frequency mode when working pileups. For example, a DX station might be transmitting on 7.070 LSB (where US hams do not have phone privileges) and receiving on 7.200 LSB (where phone is legal for US amateurs). Split mode is also used on some rigs to operate 10m repeaters (the 897 has auto offset for 10m repeaters so it isn't necessary to use the split feature for that mode).

Basically the dual VFOs are an operating convenience but are necessary in order to work stations that are operating split.

Mike,
I think Brandon covered the purpose of operating splits quite well. Typically splits are used when a DX station is working large pileups. The DX station will transmit on one frequency and then listen on another. This allows the DX station to pick out the station it wants to respond to and then respond without having all of the other stations drowning his signal out. You would set VFO A to the frequency the DX station is transmiting on and VFO B to the frequency the DX is listening on. In most cases the DX station will identify itself and then say "up 5". This means he is listening 5 khz up from his transmitting frequency. To set up split operation refer to page 38 of your operating manual. It's spelled out very well.

17584. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2007)
Date: 2007-03-01 18:09:09 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 17584

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

17585. FT897 on Batteries & ATAS 100

Yahoo group: FT897 (2007)
Date: 2007-02-28 21:13:31 UTC
From: Peter
Topic: 17585 Message: 17585

I am considering buying an FT897,but need to answer a critical question before stumping up the cash !

Part of my personal justification is to use the rig mobile (as well as portable/base), however having a modern car its almost impossible to get a feed from the engine bay to the passenger compartment to power the rig, plus of course there's the vehicle warrantee to think of.

Great ! The rig runs on Internal Batteries (albeit with reduced power), I have an ATAS 100 & mount already, I'm all set, or am I ? I've seen a post somewhere that says that the Rig when run on internal batteries cannot provide the current required to drive the ATAS 100. Has anyone used this combination ? Did it work ?

Lets hope so I really like the flexibility of multi-band single aerial working & don't want to waste a perfectly good ATAS (BTW its left over from when I has an FT100).

Tnx for taking the time to read this.

Peter.....

17586. Ok, I have ask... power output.

Yahoo group: FT897 (2007)
Date: 2007-03-02 05:12:01 UTC
From: Dean Gibson AE7Q
Topic: 17585 Message: 17589

I don't know about the ATAS-100, but when I tried to use the ATAS-120 with the FT-897D on internal batteries, I got about one raise/lower cycle on freshly charged batteries before the voltage under load dropped below 12.0 volts. Since 12 volts is necessary to raise the antenna ... you get the picture.

I think the ATAS-120 was really designed for mobile use. You are probably trying use it in portable use (as I was), and it's not very good for that, in my opinion, unless you have a better power source.

Menu #75, I believe it is. Just hold in the "F" button next to the dial until the menu is displayed then rotate the MEM/VFO CH knob until menu 75 (RF POWER SET) is displayed. At this point, the large tuning knob
will change the power setting. When finished, hold the "F" button until display returns to normal. I hope this helps.

From: kc3vo@aol.com
Topic: 17596 Message: 17596

If you internal battery dropped below 12 volts after only TWO attempts to use the ATAS antenna, it seems likely that the batteries may not have been charged fully. FULLY charged FT-897 internal batteries should show a starting voltage of AT LEAST FIFTEEN VOLTS, with 15.5 to 16.0 being typical. (This is why the special charger is REQUIRED)--73, KC3VO-Bob

Peter:
Sometimes the best path isn't the shortest. In some cars it can be difficult to get through the firewall and may be easier to run the power cables under the vehicle toward the back, where there may be an easy way in. Just something to keep in mind.
Also, don't discount all those rubber boots where things like the speedometer cable feed through. It's often pretty easy to just poke a whole through the side of one with a Phillips screwdriver and then push a cable through. The result is usually a very tight and waterproof fit and in most cases when you remove the cable the whole closes itself or can be easily patched with some rubber cement.

Subject: Re: [FT897] Need Information on how to use Dual VFOs / Split Frequency

The dual VFOs have two purposes. One is to allow quick QSY (e. g. having VFO A
on 80m and VFO B on 10m and jumping between them). I often have VFO A on HF and
VFO B on VHF. That way I can jump quickly between those two ranges. The second
purpose is to allow split frequency operation (transmitting on one frequency and
receiving on another). DX stations often operate in split frequency mode when
working pileups. For example, a DX station might be transmitting on 7.070 LSB
(where US hams do not have phone privileges) and receiving on 7.200 LSB (where
phone is legal for US amateurs). Split mode is also used on some rigs to
operate 10m repeaters (the 897 has auto offset for 10m repeaters so it isn't
necessary to use the split feature for that mode).

Basically the dual VFOs are an operating convenience but are necessary in order
to work stations that are operating split.

mrmsudawgs <mrmsudawgs@...> wrote:
I've
owned my FT-897D since January 2007. I have yet to use the Dual
VFO feature. My questions are as follows:

(1) How do you use Dual VFOs if the radio is not dual receive?

(2) Is split frequency the same as dual vfo?

(3) Can someone please provide an example of how to use Dual VFOs and
/ or spit frequency?

Thanks,

Mike

Press and hold the function key "F" for about 1 second. This opens the Menu function. Scroll to menu location #75 and adjust the power output using the frequency control knob. You can vary the output from 100 down to 5 watts.

17601. Torn Between 857 & 897

Yahoo group: FT897 (2007)
Date: 2007-03-02 20:20:55 UTC
From: weightdn
Topic: 17601 Message: 17601

Greetings all.

I'm looking at the 857 or 897 and having trouble making the decision. Have not touched either radio yet so that may actually make the final decision but, in the mean time, I am curious as to how/why you chose the rig you now have. I know some of you have avoided that decision making process by buying both but that is not an option at this time.

I guess a big part of the decision is the intended use and that is still a question for me. All I know for sure is I have 'the itch' and the only thing that is going to relieve it is a new, or at least different, radio. What I do know is, this 'different' radio will not displace my current HF rig, a Kenwood TS-850S/AT, and I do not expect it to out perform the Kenwood.

So, without trying to fit the radio to me, why did you buy what you got. If you bought both, why? How do you use it? Mostly HF (SSB, CW, Digital), V/UHF (FM, SSB, CW)? Do you wish you bought the other model instead and, if so, why?

I may delay the decision until Dayton so I can spin the knobs but not sure I can control the 'itch' that long. Besides that, at current prices, they would have to be at least $50 cheaper than Internet prices just to cover the tax in Dayton.

Thanks,
Mike / W8DN

You are not the first person to pose this question to the list, and I'm sure you won't be the last. Check the archives for prior discussions.

Meantime, I'll weigh in with my two cents worth.

The 897 is my only rig, and I move it between two vehicles, as well as between my primary residence and a forest cabin in the Southern California mountains, and on some extended trips.

For me, the choice was pretty easy. Once I had gotten past the question of whether the 897 could be securely mounted in a vehicle (it can; I have three separate home-brew mounts I have used in three different vehicles), it became obvious that moving the 857 around would actually be more difficult than the 897, because if you put the 857 in a car, you're likely to use its split control head capability, which means you have to dive into the trunk as well as the driver's area to install/uninstall in any particular vehicle.

The 897 has other benefits as well, in my mind. Better dial and display ergonomics, the benefit of either a self-contained 110vac power supply or internal batteries, and better desktop ergonomics.

For vehicle installation, one can also use the adjustable "pedestal" type mounts, but they require screws to attach and detach (whereas my homebrew mounts allow 5 second attach/detach.

As you no doubt know, the "guts" of the two radios are the same, so the external form factor and some sort of self-contained power source are really the only considerations.

Drawbacks? Obviously, it's bigger and heavier, so for some people and some uses, that's an issue. Also, despite its rugged "militarized" looks, a couple of the knobs (especially on the right side of the front panel) are very vulnerable to impact damage, because if you bump them very hard, it will break the shaft on the encoders to which the knobs are attached. (we're not talking pots with 1/4" steel shafts here.)

In my mind, the 857 is essentially a single-purpose radio that's great for mounting in a vehicle, but not the first choice if you want to move it between vehicles, or use it anywhere other than a vehicle.

BTW, although I have never owned an 857, I did own a Yaesu FT-8900 for a while, which has a size and split head similar to the 857, so I am familiar with what it's like to use that radio in different settings.

We are getting these questions a couple times a week. I admit that the Yahoo! search facility is awful (and slow), but if you go to the group's main web page and click on messages, you will see within the last couple days a thread on the subject. The discussion is so common I routinely post a link to my views (http://www.ae7q.net/board/phpBB/viewtopic.php?t=329), and there are others with valid views on the subject as well.

Note to Barry (the moderator): Since this is such a common question, perhaps a note on the group's main web page about where to go to find answers? If someone would make a balanced summary of the topic, it could be posted in the files section.

Every car has some access through the firewall into the engine compartment. You probably have some holes covered with rubber knockouts that you can use near your foot pedals. Just drill an appropriate sized hole in the rubber knockout and feed your wire through it. That way, your compartment stays sealed from the outside environment. Run your wires to your battery and power your rig that way.

You can ask any car audio expert / person where your grommets / knockouts are and they will be glad to show you. Stop by Circuit City or Best Buy - even those guys will know.

One suggestion on power is to have a place that installs audio or alarm systems run the power for you from the battery into the passenger compartment. It will cost a little, but it is worth it as they know where they can drill and feed the wire through. Just have them run the wire and you can do the rest.

Date: 2007-03-02 11:02:13 UTC
From: Niel Skousen
Topic: 17585 Message: 17607

Peter,
there is another consideration. Granted running SOLELY on internal batteries will have problems for the ATAS tuning, you can still set up the mobile installation to use a low current source (like a tap off the cigarette lighter) to maintain a full charge on the 897/ATAS system, and the internal battery to provide the high current needed for TX etc.

I've not used it this way (still shopping for a used 897D ;-)) but that's how my entire shack works, 40AH of gel SLA batteries trickle charged by a 3A supply.

From: Hussain
Topic: 17610 Message: 17610

Hello,
OMs,

Can any one help me to find out the problem in my LDG Tuner just attached on left side of my FT-897D ?

I just plug out the data cable from the back side of my rig , plug in direct dipole to rig, to check the swr press the ptt and give the tone through microphone , i don't know what hapend my FT-897D reset as factory default,
i wonder why it happend every velue is in factory setting, RIG is working normal, when i plug in the data cable to Tuner and try to tune the dipole there is no activity, only light on the tuner on by pushing the botten.

73s,

AP2GH/HUSSAIN

17611. Re: [FT897] Torn Between 857 & 897

Yahoo group: FT897 (2007)
Date: 2007-03-02 22:32:17 UTC
From: Brandon Cruz
Topic: 17601 Message: 17611

The 'guts' and the feature set of both the 857 and 897 are virtually identical. Also, in terms of price, if one adds the TCXO to the 857 so that it is equipped the same as the 897 then the price difference is essentially nil. Therefore those criteria can, for all intents, be set aside when comparing those two rigs.

The decision between the two really comes down to one thing - what you intend to do with it. For example, if you were planning to use it in a mobile environment there's no question - I would go with the 857 because of its smaller size and detachable face (the separation kit is free from most dealers when you purchase the 857). If you plan to use it as a portable (field) rig I think the 897 is really the better choice as it can be a self-contained package with internal batteries. If the rig is generally to be used at home then I would again probably go with the 897 because of its slightly better ergonomics in terms of buttons.

The primary reason I went with the 897 is because of its portability. I like the 'all-in-one' package that it provides. That's not to say, of course, that the 857 couldn't be taken out in the field - it's just that it's necessary to have a separate power source (and therefore another package to carry) with the 857. I also have an FT-817 because of its ease of portability. I have considered HF mobile operation, though, and there's no question if I do go that route then I'll buy an 857 for that installation, because, as noted above, the 897 isn't as well suited to that mission.

To answer your question regarding use - I primarily use the 897 for HF (in fact it is my primary HF rig). I do use it a bit for 2m/440 FM and occasionally for 6m but those functions really are secondary for me.

weightdn <w8dn@...> wrote: Greetings all.

Menu 74 for each band....

But: you can also build a little item to plug into the ACC
port on the back. Supplying up to -4v DC will dial back power
for any band you're currently on.

I use the little DF1QQ_tuning_switchbox_for_ft_897.gif found
in the Files section to tune (I have a manual tuner).
I think I'm right at 4v and it reduces power to about 10w.

In testing it, it's continuous. Less voltage, less power
reduction.

You need to connect the CAT cable between the tuner (CAT IN port) and the radio to enable the antenna tuner to switch the radio to CW mode and to key it. The data cable alone will not work.

Antenna plugs into top/rear of tuner, Connect tuner to rig with short coax. Plug CAT cable into CAT port of rig and the other into the Tuner. Buy the ACC accessory cable and connect that between the rig's ACC port and the tuner. This gives a 1 touch tune...pressing the button changes the mode to AM reduces the power to 5W and tunes the antenna.

Maybe I missed something in the translation but the cable goes into the CAT port NOT the data port.

17616. Wideband transmit noise

Yahoo group: FT897 (2007)
Date: 2007-03-03 11:16:23 UTC
From: Keith Ferguson
Topic: 17616 Message: 17616

Hi, all,

I've just acquired a used 897D (about 2.5 years old, according to the serial number), and have noticed a problem that I don't think existed on one I had a year or so ago, although it's possible I just didn't notice it, due to the way I was using it.

I use the 897 alongside another HF radio (a 756PROIII). The Icom's using a doublet, and the Yaesu uses a TFD located about 10M away and at 90 degrees to the doublet.

When I transmit on the Yaesu (at any power output, and with or without modulation on SSB) on any HF band or on 6M, HF on the ICOM is pretty much unusable, in that I receive wideband noise across the whole HF spectrum. This is a problem that I haven't encountered before when using other HF radios alongside the Icom in the same antenna configuration.

I've done a search of posted messages, and can only find one that describes a similar issue, and that has no follow-up posts.

Does anybody know if this is a design "feature" of the 897D, or a known fault?

Keith

welcome dear om w1pr
Thanks for reply
Sir,
I have already contacted CAT cable between provided with LDG At897
and it was working fine.

may be the cable is broken let me check it and then i will infor you
again later on today.

Try opening it up an checking you bias currents in the output stages.

Yaesu never seem to get these right as per the tech manual, the worse they are the more sprogs the radio generates.

How on earth some of them got through test I don't know, but the Bias is easy to adjust you just need a simple DC ammeter.

It would be my first check on any 857 or 897 whether it was showing problems or not.

The LDG AT-100Pro also has some challenges on 6M.

In some cases one needs to add some toroids to keep
6M RF out of the tuner.

Any word if the LDG AT-200Pro is better on 160M (I
sometimes have trouble loading a 120ft doublet) and
6M than the AT-100Pro?

Nick

If you can get Hamlib going and then there's a few applications that can be used - which distro are you using?

I had my '897d running gmfsk at a radio rally in the valley I live in, the Telford Hamfest - we had a 20m wired cut dipole and worked a DL station on PSK31. I was using the serial interface CT cable but normally from home I use a USB interface which I've not had so much luck with, the audio-in and vox work on the PCLinuxOS distro, but I mostly use MixW for now.

How about trying the legacy radio under wine? (but best not, under the influence of, though).

If you can set the VFO's on two separate bands can
you operate split across bands?

Satellite ops often are across bands so I am guessing
that is an option -- does that option extend to any
HF frequency to any HF, VHF, or UHF frequency?

Does the FT-897/857 have the ability to do cross band
repeat, say 440 in and 10 or 40M out, then 10 or 40M
in and 440 out?

I have attached the article from Astron authored
by Kevin K. Custer, W3KKC which describes the single
resistor mod. that I have in mind.

I am floating my VS-50M across a large battery and
have a West Mountain Radio PWRgate PG-40 in between.

"The PWRgate uses two 80 ampere Schottky diodes
connected as an OR-Gate to isolate the battery
and power supply from each other. These Schottky
diodes have a forward voltage drop of only 0.4 volt
maximum thereby dissipating only 16 watts at
40 amperes. The PWRgate has a built-in mini-charger
circuit made up of a resistor and diode that will
provide up to 1 ampere to keep the battery fully
charged."

WDYT?

> The Astron battery backup modifications are not exactly trivial. It's

KD4E:
Sounds like a good arrangement and that seems to cover all the issues. I don't think you'd need the "resistor mod" with the PG40 since the diodes in it would protect the supply when mains power is down.
The only thing about the PG40 is the charge rate, which is rated at up to 1 Amp. Since the charge rate decreases as the battery charge level increases, it can take a considerable amount of time to charge the battery. The docs for the PG40 even state that it can take up to a week to achieve a full charge. It's nice to have a backup system that can charge reasonably fast so that you get at least some charge back in the batteries if the mains come back on for a short time. However, if that's not a problem for you, then this should work fine. Otherwise there's the PG40S that has a more advanced charge circuit. Neither are cheap, though.

Mark,

Many thanks for that. I've just checked it, it was way off. Adjusting it close to the value specified in the manual has solved the problem.

I say "close to the value" because I found that the adjustment of VR3002 was right up the end of the track, and attempting to set it to the spec value takes it to the end and way over the top. It's now set to 250 mA and works fine. There may be another problem here, but I'm not sure I want to go there!

First - power off the rig. Once off, press and hold the "Home" key while turning the rig on again. This resets all factory defaults which should clear up any problems you may be having. I had to do it myself.

Second - The "Skip" command is not described very well in the manual and I had trouble with it as well. After you hit the "F" key the menu should open allowing you to toggle through all the screens using the "Mem/Vfo Ch" knob. At the bottom of each menu screen you will see the word "Skip". Press this button only if you never want to see this particular menu set again. "Skip" literally means, "Skip this menu window the next time I press "F" " so be careful not to select skip unless you mean to. The "Skip" allows you to customize your rig by filtering out all the unnecessary menus leaving only the ones that are important to you.

I hope this helps.

Doc,
They are separate VFO's and you can do cross band splits. depending
on the frequencies you're using, you may have to turn off the
automatic offsets. Cross banding is great for satellite operations.
Cross band repeater operation is different. I haven't tried on my 897
but it should work. you would set the receive frequency on VFO A and
receive on VFO B. To key the repeater you would also have to set the
correct tone to key the repeater.

17636. Re: LDG Tuner is not working

Yahoo group: FT897 (2007)
Date: 2007-03-04 07:11:08 UTC
From: Hussain
Topic: 17610 Message: 17636

Yes I did,
Thanks for replying me Dear W1PR and Mr. Johnny

I do the following:

1. First of all i have checked the CAT cable by the
AVO meter, it was ok.

2. I tried to conact the Tranceiver to PC with CT-62
cable by using tuner CAT out Port, it did not work.

3. then I tried to the direct Transceiver CAT port,
it also was not working.

4. I checked the menue no.20, it was on for Tuner,
but tuner nor CAT was working and also could not
change the setting by turning the main dial nobe.

5. after find out this problem i have switch off the Rig,
then ON by pressing the power button while pressing
the "F" key.

6. Radio On , I attached the CT-62 cable directly on the
rear panel of Radio , it was working.

7. again tried with the Tuner, now tuner is working perfactly.

One thing, Tuner is working, CT-62 is working with direct port of
Radio, but not working with Tuner out Port.
I don't know whether it should work or not by using Tuner out port !

How do you re-instate the menus, short of a full reset?

From: Mark Vaughan
Topic: 17629 Message: 17638

These are pretty forgiving without any load.

I have a thought, it may be wrong, no manuals with me at present.

If I remember rightly when setting the bias in one of these, there is a link we remove to measure the current.

A friend did his and left the link off, can't remember whether HF or VHF/UHF stopped, but I know he lost one output.

The link isn't that vibration proof, it's a long shot, but it may just have dropped off on yours.

Try this:

Press and hold the "F" key to activate the menus. Dial over to menu 001 which is "EXT Menu". This means "Extended Menu" or show all menu windows - even those that were "skipped" at one time or another. Turn this function on and ever menu should be activated.

17640. Re: Need Information on how to use Dual VFOs / Split Frequency

Yahoo group: FT897 (2007)
Date: 2007-03-04 15:58:06 UTC
From: Dennis
Topic: 17580 Message: 17640

As stated, you would need to set VFO 'A' for one freq. and set VFO 'B' for the other. Then select the 'Split' menu on the ABC menu display. That should get you into split mode. I use the split option for working the ISS (up on 2m - down on 70cm) and it work well!

Hope you figure it out!

Dennis - N8BMB

17641. Re: no output on hf

Yahoo group: FT897 (2007)
Date: 2007-03-03 19:00:45 UTC
From: ron
Topic: 17629 Message: 17641

I had very low receive at one time which was caused by some service menu memory locations being changed by I think an intermittent power connection at the car battery. The memory locations had to do with receive intensity settings. I don't know if in your case something like service menu values could have been changed, but you might search and look into that. I found a list on the internet for a ft857 of original location values, although they were close, they were not identical to mine. Many of the values are calibrated settings for your specific radio. Kenwood could probably know just what locations to check. I manually have copied all mine down for future reference.

17642. Power Out Momentary Jump On AM Operation

Yahoo group: FT897 (2007)
Date: 2007-03-04 19:25:03 UTC
From: thb201
Topic: 17642 Message: 17642

Hello group:

The other day I was fooling around with the AM mode at low power. I set the power output to around 10 watts but I noticed when I pushed the PTT button the power output would jump up to some higher value for a fraction of a second and then drop to the lower value I had set. If I raised the power out setting the jump would be higher. I was not speaking into the mic, just pushing the PTT button. I've checked this with three external power meters and they all show the same jump in power. Is this normal? Thanks in advance.

Hello ! Sadly it is normal for alot of the newer transceivers..... If you are using the '897 in an application where you cannot have an RF spike , please consider using a well regulated , adjustable voltage onto the ALC connector. Consult the owners manual for the correct voltages and hookup to the rig......
Please enjoy your FT-897d , I really like mine.

If the"Momentary Power Jump" is only 4 times carrier power or less, So what? The power should peak that high during AM modulation, so whatever you feed the output into will need to handle this power level, spike or not! It seems too many of us have little/no knowledge of how AM carrier vs PEAK power is related! (If you use an amplifier, and set AM carrier to 10 watts, the amplifier should be designed to handle drive levels of 40 watts or more, or you will have poor quality AM!) The amplifier needs to REMAIN LINEAR over the entire power range, not just at carrier level. If your radio has spikes greatly exceeding 100 watts, then that IS a proplem!---73, KC3VO-Bob

Yahoo group: FT897 (2007)
Date: 2007-03-05 01:09:41 UTC
From: Louis Perley
Topic: 17601 Message: 17649

No, the only limitation on 'cargo space' is that the 857 doesn't have space for the batteries or the internal power supply of the 897. In both my 857 and 897D I have both filters installed. I just looked, the TXCO is a $100 option that can still be added to the 857, so between the two, the expandability is the same. The TXCO comes standard on the 897D. Make sense as the internals are identical.

That does make me wonder though, if my FT-857 actually drifts that much more than the 897. If it does, I've never noticed it.

From: Petr Malý
Topic: 17651 Message: 17653

Hi Carlos,

There are no special demands of my software. It only "sees" the COM port.
I use the original Yeasu CAT cable (I think it is CT-62) and a cheap USB <-> Serial converter.

Activate you menus (press and hold the "F" key) and dial to menu #1.
Turn on the Ext Menu which means "Extended Menus". This will make
available all menus even ones you had pressed "skip" on (which makes
them disappear from the rotation). Enjoy.

17659. Strange UHF behavior - need help

Yahoo group: FT897 (2007)
Date: 2007-03-06 05:42:30 UTC
From: webfootwandere
Topic: 17659 Message: 17659

I've searched the site, but if the answer is here, I've missed it. My 6 month old 897D is set up thru an LDG Z11 Pro to a vertical on the HF side and a 144/440 J pole on the VHF/UHF side. All is fine on the HF side and 2m, but tonight I tried 440 for the first time and SURPRISE ...I have RF on the HF antenna port into the LDG Z11 Pro and it tries to tune!

All HF works fine on Tx and Rx and the tuner functions normally. 2m works fine both Tx and Rx and the tuner is dead - obviously not in the circuit. I put the antenna analyzer on the J-pole and all is fine there. Coax to tuner and both antennas was new with the radio.

Has anyone else experienced this? Things to check and suggestions before I send it back to the Yaesu service center would be greatly appreciated.

Rick AI4LG

17661. Re: [FT897] Strange UHF behavior - need help

Yahoo group: FT897 (2007)
Date: 2007-03-06 08:00:23 UTC
From: Randy Charles Ford
Topic: 17659 Message: 17661

This is a known issue with the FT-897 and Z11 Pro. The Z11 Pro requires ;less than 0.1W RF to attempt to re-tune, and does not limit what it's looking at to HF/6M. The FT-897 leaks less than 0.1W onto the HF port when transmitting UHF. Some people have some problems on VHF, too. Not every setup shows the incompatibility.

There are several work-arounds:

Place the tuner in semi-automatic mode, either when using UHF, or always if you press the TUNE button to tune. The lights will still flash, but the relays won't click. FUNC DN toggles between semi-automatic and fully automatic mode.

Place anything between the FT-897 and the Z11 Pro that will attenuate the UHF somewhat, such as a diplexer or a detuning stub. Add more coax between the radio and the tuner. Someone here has reported that laying the coax between the radio and tuner is laid in a figure eight prevented the problem.

It can be argued that either, or both, LDG or Yaesu are to blame. Both of them seem to feel that their equipment is working properly. The reason this problem only shows up with the LDG Z11 Pro is because that is the only fully-automatic autotuner that requires so little power to trigger an attempt to re-tune. LDG's marketing of the Z11 Pro is oriented toward semi-automatic mode. The QST review of the Z11 Pro used it in semi-automatic mode, as well.

Some people have similar problems with the Z11 Pro that is due to RF coming back into the radio via the HF antenna, or other means. This happens sometimes when transmitting on a totally different radio and antenna. This affect is also not limited to UHF energy. It's succeptibility seems to originate with it's design as a very small, low current, tuner that will operate in a low QRP mode.

17662. Re: [FT897] Strange UHF behavior - need help

Yahoo group: FT897 (2007)
Date: 2007-03-06 11:29:59 UTC
From: kc3vo@aol.com
Topic: 17659 Message: 17662

Your UHF antenna might be too CLOSE to the HF antenna, and radiate enough power into the OUTPUT side of the tuner, via RF pickup, to cause it to tune. If the problem goes away when you connect a dummy load to the UHF side of the radio, EXTERNAL RF is your problem, and the radio is OK! If the problem IS still there when busing a UHF dummy load, adding an open circuited UHF 1/4 wave stub, at the input of the tuner, should eliminate it. The actual length of the stub will vary, depending on the coax used, but expect it to be near 4 inches. (the formula for calculating length is in the ARRL handbook) You could also open the tuner, and solder an open 4 1/2 coax stub across the RF input connector, and trim it shorter, about 1/4 inch at a time, until the problem goes away. 73, KC3VO-Bob Curry

Ozzie,
I may need more info in order to help you, but try this. Once you've selected the band (say VHF), press the V/M button at the top of the rig near the right. The VHF tuning knob is not the main VFO knob but rather the MEM/VFO CH knob on the top right. Hope this helps.

Many thanks to Randy. I did further testing this morning and found that when I transmit on UHF, the HF port does in fact have RF, something less than 0.2W (accuracy is limited on my meter) - but RF definitely was there. RF out on UHF port was per rig setting. No discernable RF on the HF port when transmitting on VHF. Tried changing the 18" coax jumper between the HF port and the tuner for a 48" jumper - no joy. Tried switching the Z-11 Pro to semi-auto tune when transmitting UHF and that works as Randy says.

I'll just toggle when I work UHF as I love the Z-11 Pro in auto mode on HF. I'm certainly not going to throw stones at either LDG or Yaesu over this minor problem. But it was scary last night - visions of having to send the rig back for service - it's too much fun to be without!

The large tuning knob does not function in FM mode. You tune with the smaller tuning knob. This confused me at first, too. You can change to USB or other modes to tune with the large knob. You probably have the radio set for tone squelch. This will prevent the squelch knob from functioning. Actually, it does function, but the tone squelch keeps the receiver muted unless the proper tone is present. That's why you hear the local repeater.

From: James Wilson
Topic: 17671 Message: 17672

Any radio can do this with PSK it's easy with other technologies it's more difficult. The Tentec radio is the first radio that can operate on the internet with nothing else besides an internet connection. Also the Tentec vii has an optional built in tuner.

Using HRD and some voice software like skype the ft-897 could be used on an internet connection.

I do use my radio remotely with PSK attached to a computer and it works well.

There is a menu setting that will allow you to turn on the large knob
for FM operations. The actual menu number has slipped my mind.

I have mine on which gives me the option to use either knob. I use one
to "get there" and the other to fine tune.

Topic: 17659 Message: 17676

Bob- The problem is definitely out from the radio. The measurement was made HF port to watt meter to dummy load. The HF antenna and tuner were completely out of the circuit.

Thanks for the suggested fix. That would definitely work, but for now I'll just toggle the tuner. Might want to sell that Z-11 Pro someday, but I doubt it!

Sweet! I hope I can find a freeware version that will do some of the same stuff. 75 Euros is not a bad price for that particular software considering all that it does.

What type of cable is required to connect the Ft-897D to my PC for this type of control?

Thanks,

Mike

Actually, the 10 K Ohm resistor mod to allow Astron linear power supplies to float a stand by battery is also described in the Hints & Kinks column of the September 2004 QST. Once caveat is that you need to fuse everything in the event that the crowbar circuit ever fires. My article there shows how a RigRunner can provide the necessary fusing and make the connections a lot neater.

I've been floating a gel cell that way for five years with no ill effects.

Likely lost in all the replies, but Ham Radio Deluxe is an excellent rig control program which has a very good PSK31, Mapper and log program included.

Many will tell you that it is NOT a contest logger, and I don't believe that it was ever intended to be, but it is truly a very good Swiss Army Knife.

http://hrd.ham-radio.ch/

Good luck de Gary, WB5ULK

How about the Astron switching power supplies (eg, SS-30)? A call to
Astron about a year ago got a tech who said there was no problem if the
power supply lost power with a battery attached. However, if someone
has looked at the circuit, I'd feel better ...

From: Lew Phelps K6LMP
Topic: 17681 Message: 17684

Ozzie, I have a request for you and some other posters to this list.

Please put something in the subject line of your postings that
provides more detail than "need help," which has been the subject
line of several of your postings, on totally unrelated topics.

How about:

Subject: Problem with installation of LDG-897

or

Subject: Need Help with installation of LDG-897

This is a courtesy to all readers of this list. If the subject line
is specific, it makes it easier to determine whether I want to read
the post. SInce I don't own an LDG-897, there's no way for me to
respond, and no need for met to read either the post or its replies.
But the vague subject line forces me to delve into the contents.

Thanks and 73
Lew K6LMP

17685. RE: [FT897] NEED HELP

Yahoo group: FT897 (2007)
Date: 2007-03-07 22:02:27 UTC
From: Ken Bandy
Topic: 17681 Message: 17685

Ozzie, did the unit have the "Y-ACC" with it that goes from the ACC jack of the radio to the tuner. This will place the radio in CW mode for the time it's tuning. If you bought the unit used, and it doesn't have the Y-ACC cable, then you will need to put the radio in CW, or AM mode to make the radio transmit a signal for the tuner to work with. The menu setting on the FT-897 won't matter, due to the fact that the only thing the AT897 does with the CAT cable is take power to operate the tuner.

Hope this helps.

73,
Ken
KC9GLQ

From: james@wilsonhaven.com
Topic: 17681 Message: 17686

The LDG AT-897 is a wonderful product but has no real interface to the radio. It is a manual tuner in that when you change bands you have to return the tuner, the second tuning for the same antenna on a pre tuned band is quick.

Install the LDG.
Install the cat cable to the LDG.
Install the antenna leads as specified.
Goto the band you want to use find a silent spot turn your power down to 5 watts.
Change the mode to FM or CW. I haven't tried AM yet but it might work.
You want a constant non fluctuating carrier, SSB won't work.
Transmit with the radio while transmitting push the button on the LDG.

You should hear a bunch of clicking once this is done you should have a fairly low SWR. Y

ou have to do this for each band your going to use, once you have done this though retuning is easy and not intrusive to the band.

For retuning
If using SSB as soon as you start talking press the button on the LDG it should click a few times then stop immediately. Not sure if this works on CW but it does on SSB.

As a reminder per FCC rules any QSO no matter how short must include your call sign at the end of it.

17688. FT897 and SWR

Yahoo group: FT897 (2007)
Date: 2007-03-05 11:34:56 UTC
From: Peter Short
Topic: 17688 Message: 17688

Hello all,

I have just bought a FT897 (migrating from a FT857) and find the SWR shut-down circuitry a bit over-sensitive.

Where all my antennas worked OK with my 857, they don't with my 897. On 10 mhz the power reduces to 40 watts, whereas with the 857 it was fine!

Is there any way to turn down the sensitivity of the SWR detection circuitry? I have set the SWR2 setting in the setting Menu (option 70??), but not SWR3 yet, as I do not have a 150 Ohm dummy load as yet.

Any advice would be appreciated.

Is it just a case of fiddling with antennas until I get them spot-on,

regards and 73s Peter G4WJJ

Go to menu item no.1 and turn it on, then try to get #86. I assume you
have an FT-897.

Well I would try putting a watt meter on the uhf connector between the radio and antenna then xmit on UHF and verifying it's transmitting. Then I would put the watt meter on the HF side between the radio and tuner and see if anything is coming out there.

It could be that the tuner is reacting to the UHF due to proximity (improper shielding etc...)

17693. One more time: connecting an Ameritron 811 to the 897D

Yahoo group: FT897 (2007)
Date: 2007-03-07 18:01:49 UTC
From: banners_dad
Topic: 17693 Message: 17693

I know it has been discussed before. In fact I did a search for this thread, read a dozen or so posts and still no luck. I opened the 897D and found the J1027 jumper--it had already been jumpered on pins 2 and 3. So, unless I read it wrong I can now connect between the ACC jack and the relay switch on the amp. Now, the ACC takes a stereo mini-plug while the 811 takes an RCA plug (two pins). So I tried virtually all combinations of the three wires from the mini jack to the RCA plug but the amp still does not respond.

Possibly I didn't understand the various posts. I'm wondering if someone who uses the 811 amp with the 897D could either send me a wiring diagram, or better yet post it in the files section.

Thanks,

A USB to CAT/Linear cable costs about $20, Ham Radio Deluxe is free and will run on a low level PC such as a MS Windows 2000 based machine. One of the freeware VNC variants will get you remote control over the PC. What I don't understand is how the VoIP software handles the Mic and speakers. How do you hook it up?

17699. Mars/Cap modification on new unit FT-897D

Yahoo group: FT897 (2007)
Date: 2007-03-07 23:23:44 UTC
From: ve2mel
Topic: 17699 Message: 17699

Hello everybody , I purchasse a new ft-897d a couple of week and when I'm looking inside of the radio to make cap modification , I have only 2 resistor 0 oHms (1002 and 1001) jumper in place... and i'm looking everywhere on the net and don't find any information about why I have only 2 jumper...! I found many mod with original jumper have 3 jumper (1002 , 1001 and 1006) in place, my radio is build in september 2006 and it's a A2 region

can you help me to make modification to open wide tx please

and is somebody know if is possible to open vhf up to 174 mhz in RX only

Many tank's to all

Eric , VE2MEL

17700. Re: [FT897] Re: car batteries

From: kd4e
Topic: 17410 Message: 17700

You are correct re. the charging, though it should
only be an issue if the power supply if ofline for
for a while as the PS supplies rig power not the
battery.

I did recently discover that the battery was down,
though it is not a true deep-cycle but a multi-
use marine trolling battery. I keep a Vector
charger for bringing it to full charge -- though
one may forget about using a radio while the Vector
is running as it generates heavy RFI across the entire
spectrum. :-(

> Sounds like a good arrangement and that seems to cover all the issues. I
> don't think you'd need the "resistor mod" with the PG40 since the diodes

Hello,

Broad-banding the TX on the FT897 seems to be a softwarte mod. If u go to..... http://www.dl4cu.de/....
There is a small program to accomplish this via the CAT interface.

Care should be taken with this program though....if u program it incorrectly, you may get problems,

Regards

Is that the "D" Model, that has to be hardware modded with the CPU Jumpers??? This is the model I have. Of course I am not thinking of modding it in this way, but have a NOV for 5 Mhz. Any ideas how THIS Mod is carried out, then???

regards

17705. Need Help with LDG AT-897 Tuner

Yahoo group: FT897 (2007)
Date: 2007-03-08 16:36:11 UTC
From: ka1de
Topic: 17705 Message: 17705

I installed the tuner yesterday and installed all cables. I pushed the tune button and the red light comes on only for 3 or 4 seconds. I did this with the g5rv and I set it up with about 5 watts. So I went to a clear freq on 40 meters and put the output up to about 90 and then transmitted with it and I keep getting a blinking HSWR. Can any one help me with this. tnx ka1de/ozzie ka1de@... I use yahoo messenger for voice...

Dave,
I understand that this is ONE solution, but really now, one should be
able to make a cable that will hook the 897D direct to the 811. It's
just a matter of figuring the correct combination of pin-outs on the
two accessory jacks. Thanks for the response, but I really don't
feel like buying one more piece of ham equipment for what should be a
much simpler fix.

Make sure that you are transmitting a signal. I use AM for the carrier. SSB does not have a carrier and so there is not transmission if there is no sound into the microphone.

From: Ken Bandy
Topic: 17705 Message: 17709

Ozzie, on what frequency/band did you do the tune? The AT897 is not at "auto-sensing" tuner. By this I mean, it won't initiate a tune on it's own. You have to push the "tune" button on it to retune when you go to a new band. Also, I usually use about 10 watts to tune. 3 to 4 seconds would be about right for a tune. Depending on where you last tuned, it might take longer or shorter to tune.

73,
Ken

Ok, so you can control the radio by buying one of these USB to
CAT/Linear cables off Ebay. You can control the HRD machine through
the Internet with VNC and some kind of dynamic IP mapper like No-IP,
but how do you connect the Microphone and speaker to the computer?
Just through the sound ports? Is there a microphone (RJ-45) to 3.5mm
adapter?

Subject: [FT897] Need Help with LDG AT-897 Tuner

I installed the tuner yesterday and installed all cables. I pushed the tune button and the red light comes on only for 3 or 4 seconds. I did this with the g5rv and I set it up with about 5 watts. So I went to a clear freq on 40 meters and put the output up to about 90 and then transmitted with it and I keep getting a blinking HSWR. Can any one help me with this. tnx ka1de/ozzie ka1de@... I use yahoo messenger for voice...

Thanks for the help guys! I'll get me a cable and see what I can do via
remote. Thanks again!

byronshire,

I use a RigBlaster Plug and Play. You order it with cables which fit the back of your FT-897 (or other specific rig if you are lurking). The computer end of the PnP has a USB cable to your computer, and I/O cables to fit the appropriate jacks on your soundcard.

This can be done with any one of a number of devices, not just the 3 or 4 different Rigblaster models. How they specifically attach is according to the device for sure, but generically for the '897, Cat/Data on the back of the radio, USB/Soundcard on the computer.

If you are interested in the RIGblasters, more info can be found on the WestMountianRadio site:
http://westmountainradio.com/order_us48a.htm

From: byronshire
Topic: 17671 Message: 17714

Thank you for your answers, this whole thing is just a little beyond my knowledge level, so please excuse the somewhat repetitiveness of this, but the CAT connection has mic and speaker connectors built into it, so all you need is a CAT plug on the radio end and a USB and two 3.5mm sound card plugs on the PC end? The PnP and Ham Radio Deluxe would allow me to transmit and receive even if the radio is in Timbuktu (hmm a TZ callsign...) through Skype and VNC?

Robert,

Don't depend o n the CAT connector alone. The Data connector is the one with line-level audio.

Check Page 18 of the manual, but I would suggest that you attach both cables.

From: Ron
Topic: 17716 Message: 17716

I hear of people going into the hidden menu and turning up menu numbers 024,028,032,036 to increase output power. Will the finals handle this 150+ watts on SSB ok ?

> 150+ watts on SSB ok ?

Sure, as will the finals in most solid state Ham rigs,
IF properly cooled and not used at full power in a
continuous mode as is the case with certain digital
modes.

However, you need to note that most modern rigs produce
an output spike on key-up under certain circumstances
and if you increase the average power output you also
increase that spike -- and *that* may cause harm.

Manufacturers build rigs with some headroom so as to
reduce the failure rate.

From: galaxymap
Topic: 4445 Message: 17720

I have read the posts and looked at Manfred - DF1QQ's circuit diagram. The grounding of the transmit portion works great. What I am wanting to make sure of is the green wire shown in the circuit with -4.4 volts on it leading to the ALC connection. Am I feeding the voltage backwards into my radio? I am getting 16+v showing on the screen and HIGH SWR. I am wanting to use this when using a manual tuner.

An increase in power from 100w to 150w is only 1.8 dB.

Why would someone even ENTERTAIN the idea of doing this? Do those that advocate such settings think that they are smarter that the engineers at Yaesu? If they do, why do they think that a 1.8 dB gain will be perceptible in communications (it's not)?

If Yaesu could SAFELY up the power, don't you think they'd do it, for competitive reasons?

Sorry to be a bit pointed, but in my opinion the are a lot of amateurs going out and making engineering analyses of the power output of various amateur radios without really the background to do so. We had someone recently ready to return his radio for service because it only measured 80w (a 1dB difference, not perceptible), when the problem was DC voltage drop from his power supply.

The moral is, unless you make a LARGE (factor of 2 or more) change in power output, it's not going to make ANY difference in communication.

Finally, just because you up the power, doesn't mean that your signal won't be distorted with splatter, and that just may get you cited by the FCC. The final amplifier has to run linearly in order to be within legal bandwidth limits.

At the risk of starting a flame war Dean, this is an 11 meter mentality. Our job is to
mentor those who would do this to their radio as your reply did. Good explanation.

I'm not a very smart person, but I do have a question about this power increase thing. Why is it if the Yaesu engineers are so smart they have the radio set up so the power can be adjusted by the end user above a 100 watts using the menu system??. I can understand having it adjustable 1 through 100 watts. But after 40 years of working around engineers and seeing some of their complicated and expensive fixes for a simple $2 problem I see no reason to think some are much smarter than Joe average. No disrespect to the Yaesu engineers intended.

The increase in power of ~2dB can have quite a marked effect, or
no noticable effect depending on the modulation mode used. For
example using SSB you probably will not notice the difference, but
using some of the digital modes it would make the difference
between none and fully copy.

As far as "USER ADJUSTABLE" power goes, the USER menu allows adjustment of power from about 5 watts up to the rated 100 watts. To exceed this range, you have to access the ALIGNMENT menu, which is NOT a "USER FUNCTION", and is intended for use by properly equipped and skilled SERVICE TECHNICIANS, for purposes of service, repair, and calibration of the radio. The RANGE of adjustment is there to allow compensation for gain variation among devices, and enable uniform performance. YES, in many cases, power output of almost DOUBLE rated power can be obtained, and in some cases, double power does NOT exceed the rating of the final transistors, IF they have a big enough heatsink, and are feeding a matched load. Due to the limits imposed on ham gear by SIZE, PRICE, and NOISE, it is common to operate the final with higher power devices on a smaller than ideal heatsink, with a weaker (Quieter) cooling fan than required for maximum power (200 watts)-This results in a reasonable sized, reliable, quiet operating radio. IF you increase the power, without also providing assurance of proper cooling, and ability of the transmit relays, power supply, and harmonic filter to handle the increase, your happiness MAY be shot-lived! Increasing power beyond designed levels limits ability to tolerate long transmissions, ESPECIALLY in summer type environments, and increases 3rd order distortion of SSB signals. The radio is ALSO much more likely to fail if SWR is too high!-In short: YES, it can be done, but NO, it is not advisable!--Get an external LINEAR AMPLIFIER, designed and rated for HAM RADIO (No cheap "CB JUNK"), of at least FOUR times the radio power output, and you WILL make a usable, noticeable signal difference. 73, KC3VO-Bob C.

Its a bit like over-clocking a computer:: add extra cooling and you may be OK. Alternatively you may get it wrong and the PA(s) will go pop and take one or Two things with them (expensive). You can get 200w (CW) external amplifier relatively cheap on the web now about $200. So then back off the power level on your expensive pride and joy and if you blow the external amp 1) Its is much more fixable 2) It is cheaper than fixing the 897. The real difference between 100w and 150w over an HF circuit is negligible anyway. The only 200 watt, $200.00 amps I have seen are "CB quality" (27 mhz junk)-without suitable harmonic filters for the various HF amateur bands. It is IMPOSSIBLE to properly/adequately harmonic filter for 1.8 to 30 mhz operation with fewer than 6 switchable filters, so if there is no filter switching mechanisim.circuitry, you can be fairly CERTAIN that such amp is UNSUITED for amateur operation. Most proerly filtered amplifiers of 200 watts or more will cost over $400.00 new. 73, KC3VO

Shouting was not done, simply capitalizing of items needing emphasis, as this issue has been explained previously, yet we continue to have operators wanting to use these cheap, improperly designed, and improperly filtered (CB) amps on amateur frequencies! Perhaps one of the following methods of drawing attention to key words is better? A: Test B: Test C: Test D: Test Something needs to be done to draw attention to important words and phrases. Calling capitalization "Shouting" seems related to the "PC generation" as no one took offense at the old all capital teletype or western union telegrams, which were all capitals.--73, KC3VO

Yes, if you add the suitable filters for each band segment, but most amateurs on this list do not have the suitable filters, so it is not good to recommend such usage of "CB quality" amps. I am a former FCC employee, and have held my first class commercial license longer than you, since 1969 -38 years ago! I was Chief engineer at AFRTS in Iran in 1969, and presently serve a 5,000,000 watt ERP U.H.F. network affiliated TV station in Washington, D.C. I am also listed in "Who's Who, in Science and Engineering. No, I do not "know it all" , but I do know that many use improperly filtered amplifiers on amateur bands, and cause QRM in the bands higher in frequency, due to excess 2nd, 3rd, 4th, and sometimes even 5th and 6th harmonics! Personal observations and F.C.C. records can prove/verify these facts. (I did not initiate the credentials bragging)-----73, KC3VO

With the wide variation in eMail clients used by group members, capitalization is the best way to emphasize words in messages on Yahoo! groups.

"Shouting" refers to an entire message being in all caps, not individual words. (Or InDiViDuAl letters).

I often see criticism of eMail practices, and many of them are "criticizing the messenger" rather than "criticizing the message".

On other forums, I see attacks on "top-posting", "bottom-posting", "lines too long", and other such silly stuff. You'd think in this PC-tolerant age, people could accept some variation in posting styles. One of the characteristics of human beings is that they are supposed to be adaptable. Oh well.

One VALID (oops, there's that evil shouting) criticism of Yahoo! messages is that of someone replying to a Yahoo! message without trimming the Yahoo! advertising drivel in the replied-to message, but I don't see much of that here.

Bob, you may not realise that some users of Yahoo take emails in
plain text, without the dubious benefits of font size changes,
italics, underlining, and bold letters.

I for one choose to take email in this way to economise in
bandwidth used. Why should an email be over 30K in size for a few
hundred bytes of text.

I agree with you that the occasional WORD in capitals serves to
emphasise as does starting and ending with an _underscore_ or
!exclamation! mark.

However I would consider a post written wholly in capitals to be
shouting and that is bad manners - unless I am doing the shouting
:-)

17750. Re: [FT897] Re:shouting

Yahoo group: FT897 (2007)
Date: 2007-03-11 23:40:26 UTC
From: Randy Charles Ford
Topic: 17732 Message: 17750

I don't send HTML mail, but when you do you may want to keep in mind that not everybody will be able to see anything but the stripped text. Sight-impaired people, in particular, my be using text-to-speech or braille readers. As somebody else here pointed out, many people getting Yahoo mailings opt for text only. I'm one of them, mostly because I find most of the additional formatting and "content" to be annoying, but also because they are a potential security risk.

I sometimes view my email using a remote terminal session on my ISP's server. I've had to use that approach from within companies where I have worked because email clients and web-based email were strictly forbidden due to being vectors for viruses and other security breaches. Sometimes, it just more convenient. Once my email has been downloaded to my primary machine, if I am elsewhere, I may use a remote shell session to look at the saved email, again as text-only.

Many people, especially sight-impaired, surf the web with text only browsers that have limited ability to show text formatting. (I often do it because it's faster and generally less annoying. I'm often interested in content, not presentation.)

Traditionally, italics have been used for emphasis. We also have a tradition of using underlining in place of italics where it is difficult to show italics, such as handwriting and single-font typewriters. Many people use underlining in a text-only mode by adding an underline character before and after the emphasized word, as well as between emphasized words. For example, "_this_text_is_emphasized_." This makes it stand out, even to people who don't make the connection with italics.

I find the distinction between "shouting" and "emphasizing" to be very slippery. My kids will accuse me of yelling at them, even though I and other around us don't think I raised my voice. In my view, I emphases part of it, such as "You will _not_ watch TV"; in their view, I said "You will NOT watch TV." I have a cousin who shouts everything she says, but isn't meaning to add any emphasis by it; it's just how she speaks.

As hard as it is to communicate emphasis correctly in spoken language, it's even harder in written language. I assume that people are not trying to give offense unless they make it very clear that they are trying to. (Even then, I'll probably not give them the satisfaction of seeing me actually taking offense.)

While it is considered bad etiquette to use all-caps on the Internet, I realize that some people will without meaning to give offense. People

who used mainframes for years may not have even realized that their terminal could produce lower-case letters. (Those from a Unix background may periodically forget that capital letters and vowels exist.) People who mostly use keyboards for entry to applications that don't distinguish between case may find it hard to train themselves to change case for email. Then there are some who have physical problems with their hands that make it very difficult or impossible for them to hold a shift key while pressing another, or to move their arms and wrists to press the Caps Lock key twice for every capital letter.

Not everybody has the same abilities to type, see, or to deal with language. Some have a harder time now than they did ten years ago. If I believe that one is trying to give offense, or is ignorant of Internet etiquette, I try to communicate to them via their personal email. I've found I am more effective addressing such things one-on-one instead of in front of a lot of other people. I also also don't annoy the other people as much.

You could search the archives to see if you asked the question. Of course, I could too, but I'll ask questions instead. <grin>

How are you planning to use the radio?

Are you looking for backpack, portable, mobile, marine, and/or base.

What restrictions do you have, such as length, height, CC&R, and money?

Can you put up a large tower or two?

Do you live on a mountain top, or between a rock and a hard place. (Red Mountain started in my back yard, and Sandstone Ridge was across the street. Here's where I break out in Hank William's "Down in the Valley.")

Are you willing to have more than one antenna. For instance, if it is for mobile, would you be willing to have a seperate VHF/UHF antenna?

Do you want a highly directional antenna? Will you need to rotate it?

Hi Chuck. I use the DXLab Suite of software. It includes a logging program, Spotting program, rig control, Propagation estimator, Extensive tracking of award progress, a Callbook look up program, and a PSK/RTTY program. It is all inter-operable. For instance, if I see a spot that interests me, I double click on it, that tunes my rig to that freq and mode, aims the beam (if applicable), and starts a log entry with the operator's info pre-entered. There are two great things about this suite, first is the level of support that the author, AA6YQ, gives to the software. He is very receptive to feature requests of users via the Yahoo Group that is set up for the software. Second is the price, it's free!

I highly recommend it. You can check it out at http://www.dxlabsuite.com/.

From: K6LMP
Topic: 16351 Message: 17760

Chuck, the question of "what antenna", as others have noted, depends a lot on where you're using the rig and what you are using it for.

I move my 897 to different operating locations, and have different antenna configurations for each:

1. at the home QTH, I have a 40 meter horizontal loop mounted on the roof, which tunes 7, 14, 21 and 28 mHz without difficulty and without a tuner. For VHF/UHF, I have a 144-446 J-pole and a 6 meter J-pole, fed from a single coax, and through a home-brew remote coax switch. I intend to replace this soon with 144/432 Yagis and a 6 meter quad (see below).
2. For daily commute purposes, I have a 144-440 "mini whip" mounted on the trunk lid of my Prius, and a Hustler vertical mounted on a bracket that is bolted to the frame of the vehicle. Most of the time, I leave the Hustler without any antenna/coil on top, which makes it a 6 meter quarter wave vertical. The Prius makes so much electrical noise that the rig is almost useless on SSB when in motion, so mostly I stick to FM, on various repeaters, mostly 2 meter. I also sometimes work 2 meter, 6 meter and 440 USB with this setup. I once was able to contact a station in Argentina on 6 meters on 6 meter FM, but we couldn't quite pull clear call signs out of the noise to qualify for a clean QSL.
3. I have also build a high-performance VHF/UHF "rover" station with an 11-element 2 meter Yagi, 18 element 432 Yagi, and 3 element 6 meter Quad antennas (the two Yagis mounted on one mast, the Quad on a separate one). This is intended for "mountaintopping" using a Swiss Army surplus vehicle, a Pinzgauer, as the mobile platform. I'm drafting an article for QST magazine about this, and will post it online when it's done. The Pinz can also operate in mobile mode with the same verticals as the Prius.

From: ve6xl
Topic: 17671 Message: 17761

Hello Mike,

I would suggest Ham Radio Deluxe also. Their "Remote" tool would
allow you to control all functions of the Rig from another computer.
You can even shut the power to the radio on/off.

The audio could be delivered to the FT-897D via Skype or Teamspeak.
Some also use pcAnywhere or TightVNC to remote into the computer
where the Radio is and control the Rig that way.

Send me an email if you have any questions, we have someone locally
that has done this hundreds of times.

Well mine is only 5 days old, had jumpers on 1008 and 1006, removed the jumpers and put jumpers on 1007,1008,1009,1006. Now wideband from 1.8 Mhz to UHF. This is from Australian region. Can not be softjumped as code is in CPU. Radio was build according to data code in January 2007. Did experiment a bit, tried any other possible jumper combination, always reverted back to original restrictions. This was only combination which worked. 73's

Subject: [FT897] Mars/Cap modification on new unit FT-897D

Hello everybody , I purchasse a new ft-897d a couple of week and

when I'm looking inside of the radio to make cap modification , I have

only 2 resistor 0 oHms (1002 and 1001) jumper in place... and i'm

looking everywhere on the net and don't find any information about why

I have only 2 jumper...! I found many mod with original jumper have 3

jumper (1002 , 1001 and 1006) in place, my radio is build in

september 2006 and it's a A2 region

can you help me to make modification to open wide tx please

and is somebody know if is possible to open vhf up to 174 mhz in

RX only

Many tank's to all

Eric , VE2MEL

From: n8ikt
Topic: 8844 Message: 17763

Hey guys I am new at this and havnt had this radio very long and I have a few questions about it. I plug a speeker into the back of this radio and I have to turn it up to the top to here it and without a external speeker it dont sound right . Can someone help me? Next I baught an at897 tuner and I guess I blew the fuse inside the radio . Can that be replaced without sending it to the factory?

17764. USB audio adapter

Yahoo group: FT897 (2007)

From: w7nhy
Topic: 17671 Message: 17764

Gents,
How well would something like this work on and 897D/857D

http://www.vpi.us/usb-audio.html

With HRD or some other remote, or CAT program.
Would the Mic bias voltage @ 4.5V be a problem?
.....
The USB-AUDIO adapter allows you to link your sound to a PC or MAC
through the USB port instead of a sound card. Just plug in your
headphones or speakers into the adapter and plug the adapter into a
USB port.

Stereo analog output ☐ connect headphones or powered speakers to your
PC or laptop.
Stereo analog input ☐ microphone, CD, MP3, TV, Radio, etc.
Compliant with USB 2.0 full speed operation.
Compliant with USB audio device class specification v1.0.
S/PDIF output interface.
Compatible with Windows 98/ME/2000/XP and MAC OS9/OS X.
Soft mute function.
Recording path gain with Mic boost: +20dB
Mic bias voltage: 4.5V
Audio Codec: CMI108
No software driver is needed.
No external power adapter required.
Package Includes:
USB-AUDIO adapter.
One-meter male USB Type A to male USB Type B cable.
Any feedback? Anyone using one of these?

73

You can not do any software mods at all with the later versions of the D model. All parameters are hardwired in the cpu {burned in the ROM}. As example a JA model can not be used over 146 mhz. Its hard wired and you have to change the CPU. But the jumpermods do still work as they bypass the CPU Rom. 73"s

Is that the "D" Model, that has to be hardware modded with the CPU

Jumpers??? This is the model I have. Of course I am not thinking of

modding it in this way, but have a NOV for 5 Mhz. Any ideas how THIS Mod

is carried out, then???

regards

Yahoo group: FT897 (2007)
Date: 2007-03-11 15:49:07 UTC
From: jurgen vogel
Topic: 17726 Message: 17767

I have no intentions to try to run the FT-897D on higher power. After all doubling the power only brings 3DB gain, this will most likely be not noticed on the HF bands.

However I did test my unit to find out what the power reserves are. At 13.7 volts input at the power plug, the power output could be wound up to 238 watts max. The input current increased to 37 amps. The output transistors stayed relarive cool. Well you did not burn your fingers. BUT!!!!! The intermodulation products increased drastically and went right out of spec's. At 150 watt output the distortion products did not increase measurable. This was done in our lab. I WOULD NOT RECOMMEND to increase the power over 100 watts, there is no possible need for it and will only cause problems in the long run. The transistors are driven only to about half of their rated power but the harmonic filters get quite warm. I believe they selected the matched PA transistors for reliability at the 100 watt level. So thats my two cent worth to the issue. 73's

17768. Remote Control Operation of FT-897D

Yahoo group: FT897 (2007)
Date: 2007-03-09 15:51:28 UTC
From: Aime DE
Topic: 17671 Message: 17768

Dear FT897D users,

Not yet remoting but planning to do it sometimes I
think I can send You some info on how to have all the
cables and functions as there are :
1/PTT for Amplifier
2/CAT control
3/DATA flow
4/2nd microphone
5/CW from and to PC
6/Audio to and from the soundblaster
7/6 or 9 band data for switching antennas and filters
8/ PTT or footswitch for FT897d

All this is done by the ALL on ONE board made by
ON4AOI .
I have found a local friend who made me a new bottom
plate for the FT897D so that I had not to canibalise
the original one.Only for the case of wanting to sell
the radio in the future....
Why ?? Simply to put the ALLonONE board inside the
battery /PSU compartment.
All functions are now allways available with very
short cables.
Please note that the board must be monted in a
completely isolated fashion with regard to the bottom
plate and thus the ground from the FT897D !!!!

Pse take a look @ http://users.skynet.be/ON4AOI/

Good luck and best 73 es DX

Jim - ON5UM/OP5T

Do NOT (unless you're an idiot) fool with the hidden menu settings.
They are specific to each individual radio because component tolerances
vary from radio to radio.

It puts out 100 watts because it was DESIGNED to put out 100 watts, not 150.

Enjoy it for what it is. Keep your paws off of it and it will probably
outlive you.

Hi Chuck,

I am using Ham Radio Deluxe for my FT897D also works great on my
IC706MKIIG. Top quality software, nil cost that gives you CAT Control,
PSK31, Logging, satellite tracking and lots more!!

Regards

Diamond CP-5 and WiMO GP-3W Verticals, work a treat with the FT897.

Also have a sloping Dipole for 6M and Half-Wave Vertical for 2m.

70cm does not interest me much!!

I got VQ9LA (Diego Garcia) first call, the other day.

I have bought a LDG Z100 line-flattener though, just to broad band it
all a bit.

17777. Marine Installation problems

Yahoo group: FT897 (2007)
Date: 2007-03-12 21:59:58 UTC
From: thomaszip
Topic: 17777 Message: 17777

Hello. Anyone using their 897 in a marine application? I live on a sailboat and finally got around to setting up my radio. Been inactive for about 3 yrs. Setup is an insulated backstay of about 35 ft, and a sgc237 auto tuner. Ground from the auto tuner is a 6" wide copper strap that is hanging down into the salt water. This setup was recommended by someone who is using the same setup, with excellent results. Reception appears ok, but I'm not getting out and swr is high, at least from what I can tell from the 897 display. Still learning the radio. Any suggestions would be appreciated.
Thanks.
Tom

Try running radials port and starboard along the inside of the boat and
connected at the ground terminal of the antenna. Quarter wave length,
two for each band used worked great on my Passport 40.

Hello,

It sounds like the Tuner is your problem, not the 897.

Have you tried building an interface for your SGC Tuner, it shows an indication of when it is tuned, and gives you the option of re-tuning on a certain freq and locking the tuning.

I built one for my Fathers SGC 230 in about 3 hours.

lets you know more what is going on.

Regards Peter G4WJJ

Tom:
First off I think you'll find the 897 will be a good radio for the boat.
Second, we just had a pretty extensive discussion on the IC-7000 list regarding antenna/tuner installations on boats. You might want to join over there if for no other reason but to look through that thread.
I guess my question is regarding the amount of the copper strap that is in the water and how that relates to RF conductivity to the water. In the IC-7000 discussion the guy who brought this up also had a sailboat and he mentioned attaching his the ground side of the tuner to the read keel bolt. There was also some discussion about copper strap inside the hull as well, which I think is the more conventional solution (at least for powercraft).
It would seem that if you're going to rely mainly on RF conductivity to the water that you may shooting for a varying target, particularly underway. If for no other reason it may be better to work against a good counterpoise in the boat as others have suggested.

I think in this case his opinion is incorrect.

All radio equipment responds differently in different situations, if you are trying to run an FT897 in a marine application, then it is pertinent to this group.

Not only that but it has raised only a few posts which isn't really hogging the band space, but people can argue over things like power poles for a month and that is OK.

I have recently started to take some of my kit maritime mobile, presently with little success, I am interested in viewing the results of this post.

Sorry moderator I think you are being very unfair in this case.

17788. Antenna suggestions

Yahoo group: FT897 (2007)
Date: 2007-03-13 04:47:33 UTC
From: k6daf
Topic: 17788 Message: 17788

I am new to ham radio just got my ticket in Oct 06. I purchased the FT897 as it looked to be the most for the money and wanted to make it my base radio. Since I am a tech license I purchased the Diamond V2000a antenna for the base and use it mainly on 2meter and 70 cm. I am studying for my general at which time I will need an antenna for the HF bands. I am limited on space but have no homeowner restrictions. Of course $$ is an object also. Was looking at the ATS-120 yaseu antenna and was wondering if this would fit my needs or some suggestions of other brands. I live in a two story house and have a chimmey that rises above the roof line about six foot and was figuring on mounting whatever I purchase there. I will have about a 75-100 foot run to the shack which coax should I use? I know this is a lot of questions but any info would help. I enjoy the FT 897. I also have a FT-8900 in the truck and an FT 60 and ft 50R HT so I guess I am Yaesu all the way. Thanks.

17790. DF1QQ's Tune Circuit Question

Yahoo group: FT897 (2007)
Date: 2007-03-12 22:55:27 UTC
From: Lloyd Mitchell
Topic: 17790 Message: 17790

I've been looking for a couple of days now and I cannot find the answer to the following question.

When using a circuit aka DF1QQ's or Tune-Rite's, does the mode switch to AM or FM (carrier) or does the radio remain in the mode you were in prior to turning on the circuit?

I've seen the tune-rite for approx. $28(us) and I figure I can build the DF1QQ much less than that.

Thanks to all for such a good infomation source here in the group.

I finished building my tune box last evening and it works great. I did get an email from DF1QQ explaining the error I had made in my circuit. The circuit causes the radio to transmit a CW signal, but doesnt change anything on your screen. It remains in the mode you were in prior to switching the tune circuit on. The potentiometer changes the amount of power output during tuning. This is slick!! Many thanks to DF1QQ

Why not take on the task of building your own antenna. This way, you get a better working knowledge of how and why the antenna works the way it does and also gives you an antenna that will be more efficient in the areas of the bands you will want to be working. I have made all of my own antennas and have not purchased one yet (except for my mobile) and I would have to say they work better (and were EXTREMELY less expensive) than a commercially made antenna. There are plenty of ideas and plans available not to mention the ARRL publishes a pretty good book on antennas to boot!

Good luck!

I disagree. Whilst I enjoyed the marine discussion, the moderator
should, if they feel a subject is off-topic, restrict it.

The Ten-Ten mailing list is full of:
Is windows Vista any good?
How do I change the daylight savings time on Windows98
etc etc

It may be interesting chat for some that don't get out or don't know how
to use usenet, but I want to only receive messages about 28MHz (in that
case) or 897's in this case. Not how to install antenna's on boats. I'm
sure there is a Maritime Mobile group out there! :)

No disrespect intended to anyone because as I said, I actually found the
discussion interesting...

Time I left the group then.

It no longer has anything to offer me.

All the usual 897 stuff has been discussed again and again, some of us are fed up with the same thing again and again.

Some of us want somewhere new to take the thing (897),

If there is nothing new this group can offer, except to those that have just bought an 897, what is the point in the majority of this group being members.

The Ten-Ten mailing list is full of:
Is windows Vista any good?
How do I change the daylight savings time on Windows98
etc etc

It may be interesting chat for some that don't get out or don't know how to use usenet, but I want to only receive messages about 28MHz (in that case) or 897's in this case. Not how to install antenna's on boats. I'm sure there is a Maritime Mobile group out there! :)

No disrespect intended to anyone because as I said, I actually found the discussion interesting...

Fair point I suppose. And anyway, it was just an opinion. I am more than happy for anything related to an 897 to be posted on here: uses, holidays with them, interesting installations etc. My point is that when it does digress, it should be stopped by the moderator. I don't think the marine installation had passed that point personally...

I have not but I think it would be a good accessory to have for this radio. I put my radio in my rollable backpack when I go portable. One time when I went to Catalina Is. the ship hand put my backpack down the luggage chute that caused my radio to be slammed face first on impact. This broke the rotary shaft on the clarifier and made the vfo knob crooked. I replaced the rotary control and straightened the vfo knob by loosenin the allen nut and retightened. I think a simple plastic box that would snap on the face of the radio would be all that is needed.

Hello to all the list members.

I just got my new 897 last week and I have been having a problem trying to set it up for a 6 meter repeater frequency, which needs a 100 Hz tone. (TX= 53.13, 100Hz and RX= 52.13 no tone).

I go through the procedure as outlined in the book to set the tone freq, but I don't think that the rig is generating the tone as I can not hit the repeater. Wattmeter shows output.

I have another rig that will hit the repeater just fine using the same antenna...

Also, is/are the tone(s) set for both TX & RX? I need to set it only for TX.

One last thing:
Has anyone used Ham Radio Deluxe with success with this rig?

Dear Scott.

What torroid did you use !? I guess that you might use a torroid
with a too less "AL" value. Then the RFI blocking could not work
strong enough, I think.

From recalculating the size of the torroid (from the originally mod
instruction) I think it is a FT50-xx torroid.

A FT50-43 has an AL of 440.
A FT50-77 has an AL of 1'100 !!!

So for RFI blocking the higher AL is normally better as it creates a
RF suppressor coil with a higher µH value on the same turns.

17808. Re: Marine Install Revisited. verses moderaotr complaint

Yahoo group: FT897 (2007)
Date: 2007-03-15 13:51:46 UTC
From: Bob
Topic: 17784 Message: 17808

First of all...

Did I miss something???

Was there actually a posting from the moderator to the group about this
topic? If there was I missed it!!!

After reading the orignal post I thought it was on topic as it related
to the FT897 and its operating proceedures. The replies seemed to be
all related to helping a user with his FT897 antenna issues.

I found it much more interesting than the usual questions on how can I
operate my radio out of band, how can I boost the power over 100w and
the usual question we see on the 817/857 and 897 newsgroups. But if
you wanted your radio to operate on the CB band why not buy a CB. If
you wanted your radio to operate on the AIR band why not buy an Air
Band radio. The point of the modifacations legality in the USA or
CANADA or anywhere else in the world for that matter is not the
issue.
The question is why would you buy something that did not do what you
wanted it to when you bought it AFTER doing your research?

Newbie questions are always welcome because sometimes when you read
the
manual you do miss something and having someone explain it to you in
more basic language than the manual. I still have to read the manual
when I go to re programm memories on any of my 3 radios.

Now that we finally get a discussion going on a FT 897 operational
issue (as how can I operate from a marine platform) after a few
replies
the moderator cuts it off without posting it to the group? Something
does not sound right here...

Lets get back to discussing operational aspects and technical aspects
and get back to playing radio

May be wrong, but I think all splits have to be set up in a memory
location.
HRD does work.
Haven't really used my 897 lately.

You did not give specific details on what you set up, but remember that setting up a tone is a rwo step process. You have to set the tone frequency, and you also have to turn on the type of tone. If you forgot either, you wouldnt get the correct tone or it would not be sent when you think it is.

I have used HRD fine with the radio, and I know many others that also use it. It works great!

I just got mine in December, so I'm a newbie fumbling thru the menus as well. There was a suggestion to put things into memory, but that isn't necessary. You do not have to set anything to a memory slot to get the tones to work. I was using our local repeater before I figured out the memories. One menu at a time....

If the rig's display does not show "TEN" once you are done setting the tone frequency then the CTCSS tone is not activated. TEN is gibberish for Tone Encode, apparently. Uo can adjust the TEN/ DEC/ off settings with the A button when on Multifunction row e.

FIrst, I don't think the moderator has intervened in this discussion, although several posters have urged that he do so. I concur that it's a legitimate topic for discussion on the 897 board, since the rig is "portable" by design and intent, and thus a logical choice for marine use.

Second, there's an entire chapter in the ARRL Antenna Book on Marine antennas. Not owning a sailboat, I have only skimmed it, but I recall seeing several configurations discussed, most notably a sloper running from the top of the mast to the stern, using a standard item of rigging on a sailboat, the backstay, as the antenna.

A quick search of the QST library of back issues unveils several articles on the topic. Search using "marine mobile" as keywords.

Bottom line: the ocean provides a GREAT ground, especially if you have a ground plate installed on your hull. Wire antennas can be installed in a variety of configurations, but you need a tuner in most cases, and it's best if the tuner is at the antenna feedpoint, not at the rig. Verticals work, too, especially in the higher bands where size is reasonable. (From my days in the Navy, I know that adding weight "topside" is Not Good for a boat's stability. One pound at the top of a 50 foot mast is equivalent to 50 pounds on the deck, which is still above the axis on which a sailboat pivots when it capsizes.

George and others on the list:

Thank you for the reply.

This is what I want to set up:

TX=53.13 w/100Hz tone
RX=52.13 NO TONE

(This will also apply for the 2 meter freqs I want to set up).

I understand that setting up the tone is a two step process and I need to know exactly how you 1) set the tone frequency, 2) how do you turn on the tone you just set and when you do this, does it set the tone for both the TX and RX? I do not want the tone on the RX.

I know that this seems like a simple thing to do, but the manual is not very clear.

Any help will be greatly appreciated!

What you are looking for is TEN (which stands for Tone ENcode, which is TX only). Press the F (function) butten quickly and rotate through the menu selections until you find TON for butten A. Press butten A until TEN comes up in the upper left corner of the screen. The press the F key again quickly.

To program the tone frequency, Press the F key for more than 2 seconds. Go to menu #83 and then use the big tuning knob to select the frequency. Then press the F key again for more than 2 seconds.

See page 34 in the manual under "Repeater Operation". While I think the manual is very lacking on this radio, this explaination is actually fairly reasonable.

I don't have any personal experience with Ham Radio Deluxe on my rig, but a friend of mine started using it with his FT-897. Before using HRD he hated the FT-897. Wouldn't use it because it was too "fiddley" and he was sorry he bought it. Now with HRD he actually uses and likes his FT-897. I'd say in this case that's a pretty good indication of how well the program works. Good luck.

hello all,

I want to buy the FT-897D with FNB-78 batterypack.
Do i need the CD-24 Charger or are the battery's also loaded when it's
on an external powersupply?

Topic: 17784 Message: 17824

Folks,

I have no idea what K4KMG is talking about when he said the moderator (that's me) said to stop this thread. So far, it is okay and in the general bounds. I can see that some good information exchange is happening and thoughful questions are being asked. It is not very common for marine operation to be discussed. I am a sailor and have had fun playing with a FT-817 on the boat and using the backstay for an antenna, so I do appreciate some of the comments that have been made.

AS long as the thread brings into play the application, use, and intallation of the FT-897 most of the time, fine. If the thread goes off into mostly antenna discussion or detailed marine battery maintainance or the like, then it is time to shut it down. Some discussion of these related topics is okay, but not a lot on their own.

The important thing IMO is that if you improve the antenna, then you benefit on RX as well as TX, whereas adding a PA, only adds to the TX power.

17828. LDG Electronics FT-Meters

Yahoo group: FT897 (2007)
Date: 2007-03-15 22:47:09 UTC
From: w4wb
Topic: 17828 Message: 17828

The new version of the LDG FT-Meter for the FT-897 and FT-857 is now
available from LDG Dealers.

W4RT Electronics is the LDG Master Dealer and is LDG's interface
with individual customers regarding upgrade CPUs, selling
discontinued products, and selling new, but cosmetically blemished
products.

In the case of the FT-Meter, a small number of brand new, factory-
fresh original style FT-Meters are available through W4RT
Electronics. These meters are discounted.

PRICES are as follows:

FT-Meter (current version): List $49, W4RT $46
FT-Meter (original version): List $49, W4RT $39

Specifications for each are as follows:

*** Specifications for Current FT-Meter ***

Receive: S-Meter, Discriminator or Voltage
Transmit: RF Power, SWR, Modulation, ALC or Voltage
Size: 3.5 x 3 x 2 inches
Cable length 3 feet
Sensitive 500 uA meter movement
Externally powered cool blue backlighting
On/Off switch for backlight.
Backlighting is 12 volts, 100 mA max
Weight: 0.5 lb.

*** Specifications for Orignal (now discontinued) FT-Meter ***

Receive: S-Meter, Discriminator or Voltage
Transmit: RF Power, SWR, Modulation, ALC or Voltage
Size: 3.5 x 3 x 2 inches
Cable length 2.5 feet
Sensitive 500 uA meter movement
Externally powered meter lamp
Lamp is 12 volts, 100 mA
Weight: 0.5 lb.

17829. RE: [FT897] Marine Installation problems

Yahoo group: FT897 (2007)
Date: 2007-03-15 22:47:25 UTC
From: Mark Vaughan
Topic: 17777 Message: 17829

The big yachts have special lightening conduction systems down to plates in the water. They keep this totally separate from all other electrical systems so as to sort of form a cage, safety protection zone over the vessel. I worked on the Mirabella V (worlds largest single masted yacht) in Portsmouth harbour during a lightening storm, the mast was hit several times. Other than a shower of sparks we didn't really know anything had happened.

It would seem most big yacht builders keep the lightening protection methods secret, or don't know what you are talking about when you ask. All these big boats are built to class rules, and most class rules Lloyds, DNV, BV, DV etc list their rules on their websites, you can probably find out what they do from there. I'm due to go back out on the Mirabella V in May, I'll do some poking around to see what I can find out.

Just curious ...

Has anyone seen harm to a hull from lightning
discharging off a vertical antenna into the
internal counterpoise then out through the hull
into the water?

Or up from the water, through the hull and into
the counterpoise to meet the downcharge?

However one wishes to visualize the timing and
action! :-)

Yes, But remember it takes the quickest route to water. Some people put chains off their chain plates to the water. In real hairly weather. That way it will not go to the hull keel lead to discharge, and hole the bottom of the hull. If this is a steel boat don't worry, but tupper ware be concerned.

Although price it there, then check out hro or universal for how much they will sell it for, and consider shipping costs.

Buy the kit with the cable(s) included. Don☐t forget to buy their USB adapter or one HRO offers if you do not want to use serial.

I have their software for the FT-897D, FT-7800R and VX-5R and you can import and export a tab delimitated file between them so the repeater lists are the same across all of them.

I have one and it works great. It uses a Prolific PL-2303 USB to serial chip and updated drivers can be downloaded from the manufacturer's website. It is also the only USB to serial chip that I am aware of that has a 64-bit driver available as well.

From: Brandon Cruz
Topic: 17842 Message: 17845

With the Yaesu 857D/897D 60m operation is allowed only by using the fixed memories (601-605). If you select those memories you'll see the 60m frequencies are there and that you can transmit. If you dial up the 60m frequencies in VFO mode you'll find that transmit is inhibited.

ka1de <hbthomp@...> wrote: I posted a message earlier about transmitting on 60 meters with no

Hi,

Most amateur radio rigs are designed not to transmit out of band to protect you from accidentally keying up in the wrong place. The 60m band is new and limited to the US, therefore radios older than 5 years will, by default not transmit on 60m, Many radios can be modified to transmit on 60m or pretty much anywhere, my TS-897 has a software mod that allows you to transmit pretty much anywhere, other radios can be modified with a simple hardware mod. Opening up transmit on all frequencies is called "widebanding," which should help in your Google search.

REMEMBER: Widebanding your radio means that you need to know your bands so that you don't transmitted illegally.

Please read the manual. You cannot transmit on 60m using the VFO. The
five 60m frequencies are programmed into memory locations. You must select
one of these memories in order to transmit.

Ozzie, if you have a FT-897D made for the US market, they should be preprogrammed into memory locations 601-605. If you have a "non-D" FT-897, you will have to do a wide band modification.

73,
Ken

The 60m band is NOT limited to the USA.

However other countries where 60m allocations exist may not have the
same spot frequencies as allocated in the US.

From: ka1de
Topic: 17855 Message: 17855

I want to thank all for the reply to my question about the 60 meter band. My problem was that I had menu 55 turned on. It has to be turned off to get M-601 thru M-605. So I hope this will help some one else that has the same problem. Also I found in the manual for the LDG-AT-897 TUNER that on page 8 it shows that the Y-ACC cables RED end goes to the rig and the BLACK goes to the tuner OTT prot. On page 3 is says on line three that the cable with the BLACK end goes to the radio and the RED end goes to the tuner OTT port. I tried both ways and I notice no difference. Hope I am right. So tnx again all ka1de/Ozzie

April 2007 QST article for FT-897D

"A Microphone Port for those Sound Card Modes" by Nenad Rotter, 9A5AN.
You can contact him at 9a5an@... or 1.Vidovcica 11a, 10000
Zagreb,Croatia.

He made a Mic port interface for his FT-897 so that he can use the CAT port on the mic jack. The PCB has a 1.) CAT port with RS-232 level converter. 2.) Mic interface with optional power supply for electret or dynamic microphones. 3.) PTT footswitch socket. 4.) MH-31 original microphone socket. With his FC-30 attached he had no other CAT port.

At the present, I do not have permission to copy to the web or distribute his or QST's article.
He monitors this group, so ask him.

17857. General antenna for FT-897D

Can anyone recommend a general antenna for use with the FT-897D in the frequency ranges of 160m-6m? It not for a truck or mobile purposes. I will be using it for a base station. I don't want it too big but I would like it to handle 100-500W. I know this is a broad questions but any suggestions would help.

Hi
If you don't need the PTT foot switch and to connect an electret mike you may wish to look to the CAT Interface I made. It is at the Pictures section of this list under my call sign KG4FSN.
If you have any problem in getting it please send me an e-mail and I will forward you a copy of the schematic.

Jim,

I use a horizontal loop antenna to work 160 thru 6 m. It works gang busters! The loop is just over 160 M long (560 feet) and made from 14 gage stranded wire fed with ladder line. Click the link to view a little information about mine.

I chose the 897 because whether for my home shack, or portable operation, I wanted everything in one box. I have the optional AC supply, and the LDG autotuner. Very compact. Of course, I do NOT do mobile HF work. Too much traffic here.

17865. Re: 60 meter transmit help...

Yahoo group: FT897 (2007)
Date: 2007-03-18 01:21:26 UTC
From: James Monaghan
Topic: 17842 Message: 17865

If you have an orginal FT-897 you can perform a software jump. However if you have a FT-897D model it will not take a the software jump. You can perform a simple internal mod with the software solder pad. By adding soldered jumpers to the pad it changes the radio to freeband.

http://dw.ham.dmz.ro:8080/downloads/yaesu/ham.dmz.ro.softjump.zip

Yaesu FT 897 (FT-897 FT897) Extended transmit range

Remove the 8 screws affixing the top panel of the transceiver and gently lift it off.

Carefully remove the small 2-pin speaker plug from the left rear corner of the transceiver interior, then remove the heavier 6-pin plug from the connector inside the right side of the transceiver. This can be removed by pushing on the tab to release the connector.

Locate the nine jumpers. These are located about 2" from the front edge of the main unit and about 3/4" from the left edge. You now have a choice of 2 different mods:

For 144/430MHZ TX expansion only, remove the jumper at JP1002, leaving the other jumpers alone. For the complete expansion per the above listing, place jumpers at JP1007/1008/1009, and remove the jumpers at JP1001/1002/1003/1004/1005(leave the jumper at JP1006 in place). Note the unusual sequence for the numbering. With the front of the rig facing forward, from the front of the rig to the back, the numbers of the jumpers are as follows:
1003,1002,1001,1006,1005,1004,1009,1008, 1007.
Result of radio should look like below after FULL mod was done:

----BACK OF RADIO------
1007 - Jumper
1008 - Jumper
1009 - Jumper
1004 - Blank
1005 - Blank
1006 - Jumper
1001 - Blank
1002 - Blank
1003 - Blank
----FRONT OF RADIO-----

Replace the top panel

With the transceiver off, press and hold the [F] and [V/M] keys; while holding them in, turn the radio on. Modification is now complete.

The radio is now complely reset to all the original factory settings except that it now is able to transmit 1.8-56 MHz, 137-164 MHz, and 420-470 MHz. You will need to reprogram all the menu operations and memory channels

Wow, sounds kinda familiar. I didn't do the mod, but about 4 days after running the radio on both HF and VHF/UHF, it developed a problem transmitting at more than 30 watts on VHF and 5 on UHF. I also noticed I didn't get more than 45 watts on HF. I sent it in. They (Yaesu) still have it. 6M77XXX serial number.

I own the 897D with the internal power supply. I only use the 897 for portable operations and sometimes as a base. The 897 and 857 are the same radio, just different cabinet...according to the QST review. The 897 has bigger knobs which is good but the 897 is too big for normal mobile ops. If I had to do it again, I'd probably go with the 857 only because I do most of my ham radio mobile or portable. I use a Kenwood TS480 for mobile and it's a much better radio but I'd like to have the 857 as a backup plus 2m etc...For portable operations, the 857 would be easier to transport. I took the 897 to Haiti last year and it worked fine but it took up most of the room in my pelican case.

Topic: 17863 Message: 17870

Chances are they are using an antenna that was designed and tested specifically for a portion of the 2m/440 band they want to work and have adjusted said antenna for minimum SWR, just as I have. I use a dual band J-Pole that was designed and tested for low SWR. Not hard to do if you play around with antenna.

From: Marius Petrescu
Topic: 17601 Message: 17871

Hello,

I always see the comparisons between 897 and 857...
I played around with both rigs and i want to emphasize one fact that doesn't seem to be clear to manyy people in the group:

The electronic board of the 897 and the 857 are IDENTICAL.
The only difference is that the 897 has a in line connector soldered, which allows wires to be run to the microphone connector, which is not alligned with the board, while the 857 has a microphone connector soldered directly to the board.
The 897 has some space available on the right side of the PCB, where the battery switch and some ferrite breads on the power supply lines are located (about 1 inch (25 mm)).
Except that, and the space below the rig to accomodate the internal power supply and the different front electronic, there are no differences.

So the on-air performances of the two rigs are identical, it only comes down to the preferences of the operator regarding the knob layout of the rig.

Greetings,

Marius, YO2LOJ.

Subject: Re: [FT897] Re: Torn Between 857 & 897

I own the 897D with the internal power supply. I only use the 897 for portable operations and sometimes as a base. The 897 and 857 are the same radio, just different cabinet...according to the QST review. The 897 has bigger knobs which is good but the 897 is too big for normal mobile ops. If I had to do it again, I'd probably go with the 857 only because I do most of my ham radio mobile or portable. I use a Kenwood TS480 for mobile and it's a much better radio but I'd like to have the 857 as a backup plus 2m etc...For portable operations, the 857 would be easier to transport. I took the 897 to Haiti last year and it worked fine but it took up most of the room in my pelican case.

k2bw03 <k2bw03@...> wrote: I chose the 897 because whether for my home shack, or portable
operation, I wanted everything in one box. I have the optional AC supply, and the LDG autotuner. Very compact. Of course, I do NOT do mobile HF work. Too much traffic here.

I think there is *one* item that is different between the two rigs, and that is the pair of ventilating fans which are in the FT-897D ..

The 897D may work a bit better in terms of transmit duty cycle since there are fans inside ..

Elaine ..

Subject: RE: [FT897] Re: Torn Between 857 & 897

Hello,

I always see the comparisons between 897 and 857...
I played around with both rigs and i want to emphasize one fact that doesn't seem to be clear to manyy people in the group:

The electronic board of the 897 and the 857 are IDENTICAL.
The only difference is that the 897 has a in line connector soldered, which allows wires to be run to the microphone connector, which is not alligned with the board, while the 857 has a microphone connector soldered directly to the board.
The 897 has some space available on the right side of the PCB, where the battery switch and some ferrite breads on the power supply lines are located (about 1 inch (25 mm)).
Except that, and the space below the rig to accomodate the internal power supply and the different front electronic, there are no differences.

So the on-air performances of the two rigs are identical, it only comes down to the preferences of the operator regarding the knob layout of the rig.

Greetings,

Marius, YO2LOJ.

17877. What About the Difference between 857 & 857D?

Yahoo group: FT897 (2007)
Date: 2007-03-19 13:33:45 UTC
From: kd4e
Topic: 17877 Message: 17877

I am sure this has been discussed but couldn't find
it in the archives.

Are the only differences between the 857 and
the newer 857D:

1. TCXO - may it be user retrofitted?

2. 60 meters - I'm guessing this cannot be added?

3. Other?

From: Dennis Willson
Topic: 17863 Message: 17882

I use a dual band HT antenna attached directly to the back up my 897.
The SWR just works out to be low as long as I don't position the radio
to close to a wall or something like that.

I have been known to take my 897 with the internal batteries and an HT
antenna attached to the back of it and set it on the table at a
restaurant and it works great. I just turn the power down to 5 watts.
For some reason the same antenna on my 5 watt HT doesn't work as well.

1.8 ? 54 MHz, requires just 1 watt for operation, handles 125 watts.

Over 2,000 memories for each antenna, automatically stores tuning
configurations for each frequency and band as you use them.

State-of-the-art processor-controlled Switched-L tuning network.
Match dipoles, verticals, inverted-Vees or virtually any coax-fed antenna.

Also included is the optional RBA-4:1 Balun which allows tuning
of end-fed and ladderline fed antennas as well.

Both devices are in nice cosmetic and operating condition.

DETAILS: <http://www.texastowers.com/at100pro.htm>
http://www.ldgelectronics.com/products.php?cID=2&pID=13&v=1
<http://www.ldgelectronics.com/products.php?cID=1&pID=1&v=1>

$175. for the both the AT-100Pro & RBA-4:1 plus actual shipping.
(save $55. off the new price)

Am adding an amp so am saving up for an LDG AT-1000.

17891. FT-897 "Back of Radio" antennas

Yahoo group: FT897 (2007)
Date: 2007-03-19 22:36:21 UTC
From: K9ZTV
Topic: 17863 Message: 17891

Interesting . . .

"Back of radio" antennas is a topic which hasn't been discussed much on here and probably should be.

I can successfully use MFJ's little dual-band antenna on 2 meters but it's a wipe-out on 440 due to high SWR.

Again, be sure and turn the power down for three reasons: (1) those "back of radio" antennas are only rated for 10 watts; (2) RF loves to burn human flesh when you go much above that; (3) putting higher power that close to the radio itself can risk damage to internal components.

What say the rest of you?

73,

Kent K9ZTV

I am seriously considering buying a FT 897, there are two other rigs I am thinking about for my new shack in an outbuilding with Heat AC etc. What would you all pick to go with it as far as accessories? I figure one of the Collins filters at least. I can't decide on the other stuff outside of the CAT cable. Also how does it do with a Linear Amp and which one would you choose yaesu's or MFJ? How does it cut it as a DX rig when the going gets tough? I will most likely be ordering it before July so I really need info that I am not getting in the published reviews. Oh yes how hard are the controls to operate, I know some Yaesu's have been about awkward over the years, do do certain tasks like going around the clock on the 757GX II to go from lower to upper sideband and some other things. if you were using the front panel.

Thanks for the feedback on the rig.

I would work on tuners and such before filters, and if your going to have an amp this sounds like a base station. The Ft-897 has a base station is a compromise, actually the ft-897 is a compromise rig on all aspects. I would consider a true base station if that's what your looking for.

The FT897 is a good all round rig for base station use and I have worked sum gud dx on mine using just the DSP filters. With the Collins Filters it really sings. You have 160 Meters to 70 Centimeters in one neat package. It has one of the best Receivers I have ever seen and I am an ex-professional operator and have been involved with Military HF Tranceiver Design.

The only down-side form my point of view, is that I have arthritis in my hands and find it a bit fiddly sometimes.

If you are nimble-fingered, then go for it - excellent value for money.

I own both.

Base, mobile, portable or a combination of the above?

For a base station it is a tossup. The Icom has more bells and whistles but it costs more.

Portable the Yaesu is a winner.

Mobile the Icom is a winner.

17898. G5RV on FC30?

Yahoo group: FT897 (2007)
Date: 2007-03-21 01:00:44 UTC
From: ke7hge
Topic: 17898 Message: 17898

I have an FT-897D with the FC-30 Antenna Tuner installed. Has anyone in this group had experience with this combination? Was it successful?
I seem to be able to raise or lower the antenna, or move the feedline and get a "match" on different bands (never on 60 - 80 - or 160M).
Comments or advice welcome.
Thanks, Ken.

Good day Ken.
I tried the FC-30 with a G5RV and the results were about what you are getting. I tried different lengths of coax, different run patterns, different type of coax and it was all about the same. I finally went out and picked up the LDG AT-897. That works much better. It is able to tune a broader range.

Best Regards,
Doc, KD8BGQ

Second the LDG AT-897. I have that, a G5RV up about 35 feet and attached to about 80 feet of coax and can tune it anywhere from 160m to 6m (although tuning and radiating on 160m is a whole other story). From what I have read, the FC30 will tune upt 3:1 while the LDG will tune up to 10:1.

Ke7hge/ag

Ken

I have a FT-897D with the FC-30 tuner and a 102 ft. G5RV [MFJ-1778] in an inverted V configuration with the apex in a tree about 40 ft above the ground and an apex angle of about 130 degrees. An air wound balun terminates the antenna at the end of 32.6 ft of 450 ohm ladder line. I have acceptable SWR up to and including 80 meters. .. I have not tried 160 meters as the configuration for that gets more interesting including the installation of a ground plane [which I have not done]. The G5RV is not my primary antenna . I have an Alpha-Delta DX LB plus also hanging from trees and it is superior to the G5RV on 20, 40 and 80 meters.

I am surprised that I have no difficulty with the FC-30 tuning the G5RV given its limited capability. Initially I had some problems with SWR but played with the apex angle to ensure that it was greater than 120 degrees and that seemed to work.

Trust that all is well.

17904. Helpful program for Powerline noise

Yahoo group: FT897 (2007)
Date: 2007-03-21 14:10:22 UTC
From: Bill
Topic: 17904 Message: 17904

I seen several posts about Virtual Legacy Radio for rig control. It does work very nice. I have found a added value for the program in the use of the Prog 3 button for creating a log file to show radio interference for power lines. You can change the time factor to log any interval you want. I set mine up to log every 15 minutes. I then rename the file with date and save these log files to a directory everyday. When the power company rep comes you can show them the logs. It shows 2 things, one that you have high S-meter readings and when and second it shows you are documenting the problem. It logs the time, frequency and S-meter reading. Of course it never hurts to print out a copy of the public service commission complaint form and leave it in plain sight when the rep is coming. If the power company fails you these same logs can be sent to the public service comm. or FCC if needed to help prove your case. Mod if this is an not a proper post please delete.

Forgive the possibly daft question, but wouldn't powerline noise be there all the time? Why would it vary and need logging?

I only ask as I get broadband noise around once every 30 mins or so and I always presumed it was a central heating thermostat, although it isn't ours in our house, so maybe it could be something else.

tnx for the tip...

17908. Re: [FT897] FT-897 "Back of Radio" antennas

Yahoo group: FT897 (2007)
Date: 2007-03-21 18:02:15 UTC
From: Dennis Willson
Topic: 17863 Message: 17908

I use the Pryme dual band callapsible 'high gain' antenna as a "back of the set" antenna and it works very well. I also have a Diamond tri-band antenna I use for 6m. It works OK on 6m, but does not work as well on 2m and 7cm as the Pryme does, plus it doesn't callapse so it doesn't fit into the case I currently use for the radio. The SWR for the Pryme antenna is nice and low on both 2m and 70cm.

I have ordered an antenna and set of coils for 10m, 15m and 20m and they should be here tomorrow. They are really meant for the 817 and have BNC connectors on them so they should work just fine on the 897. There is a coil that has a screw on callapsible whip on top. They should break down and fit in my carry case. I don't know if anyone has tried these, but if there is any interest I will let people know how they work.

When I am more serious about talking when portable I also have a "Super Antenna" that works reasonable for it size and portability. I just want something I can at least listen with when I am out at a restaurant or visting relatives, etc... So I'm going to try the little 'back of the set' antennas.

I also just bought a Z11-Pro antenna tuner (I got this one because my case doesn't have room for the radio to be any wider (as in the AT-897) and I liked using the internal battery pack inside the tuner.

It depends on the cause. For example, a transformer going south but
not quite gone yet, could introduce increased noise during periods of
heavy loads but otherwise appear to be functioning normally.

Intermittent power line noise is pretty common, and
tracking when it happens can help determine why it
happens and speed up fixing it.

I wish my noise were intermittent. Every signal
report I give on 40m and 15m is at least a 5/9 because
it HAS to be. Otherwise it wouldn't have gotten to me
over the S8 power line noise. It's only an S3 to S5
on 20m, so that's where I'm parking these days. 100
acres and the power line wraps around the shack on all
3 sides that I can run antennas.....I've got to get
some longer feedlines. Or a wife that lets me run
antennas from that 4th side.

Well, that about says it....

Both can be widebanded - although the newer ones have to be done with a soldering iron. I can supply the h/ware mod info if needed.

You sent your msg to the 897 group, so I will mention that the 897D comes with the TCXO fitted as standard.

I am sure this has been discussed but couldn't find
it in the archives.

Are the only differences between the 857 and
the newer 857D:

1. TCXO - may it be user retrofitted?

2. 60 meters - I'm guessing this cannot be added?

3. Other?

Not much help,

But, I've seen the results of a lightning strike to an
Rx vertical on the foremast of a tanker (we were
exiting Beaumont / Port Arthur at the time).

Aerial looked like a palm tree afterwards -
fortunately no other damage was done.

Lightning CAN have a devastating effect on GRP but at
other times seems to have little or no effect -
possibly it's the heating effect.

Thanks to all for their replies (some included below)!

I decided to buy the VERTEX CT-62 from RT Systems:
http://tinyurl.com/2ncwf4

Although their total price, including shipping, is
$4.21 more than the ebay dealer off-brand version I
placed my order with them for three reasons:

1. They are a USA company.
2. Their connector is accessible should service be
needed, the ebay one is sealed and though it
looks neater it is inaccessible.
3. I know that they support their products.

IMHO, YMMV, etc. :-)

17924. Re: [FT897] G5RV on FC30?

Yahoo group: FT897 (2007)
Date: 2007-03-21 02:36:30 UTC
From: Phineas Henshaw
Topic: 17898 Message: 17924

Ken

If you are going to use the FC30, I would simply take the coax out of the feed completely on the antenna side of the tuner. This would technically turn the G5RV into a Doublette. At the end of the ladder line, somehow fix it to a PL259 connector so you can connect it to the tuner. This will allow this antenna to work on all HF bands. Using the ladder line all the way to the tuner will lower your loss, and allow the range impedence range(SWR) of the antenna to stay well with in the FC30 tuning range. A 1:1 balun will work also, but not as well.

This setup sounds crazy, but it WILL work.

Third on the LDG AT-897. Works well! My setup is with AT897 attached to 897D, 100' of coax, to 35' center mast and 10 degree down slanting "flat top". (Since it's on a hill). Tuning works well. I believe getting the G5RV to 55 or so Ft would work better...allowing lower takeoff angle. I believe the FC30 would fairly well....perhaps ...just less toerance to High SWR corrrections.

I use a MFJ-969 Deluxe Versa Tuner II. You are correct, the wire is between 30 and 50 feet off the ground depending on what tree it is in. Considering that I made my first HF contact using my Ft-897D and a long piece of speaker wire thrown out on the ground (yes! the actual ground, dirt, grass...), anything above grade is good. The higher the better but you have to make do with what you have.

Do a google search on Horizontal Loop Antennas and you'll find tons of articles.

17929. Re: Is the off-brand CT-62 Cable OK?

Yahoo group: FT897 (2007)
Date: 2007-03-22 02:22:56 UTC
From: Robert G. Schaffrath
Topic: 17819 Message: 17929

It looks like a good cable. The only reason I did not go with it is that I would still have needed to get a USB to serial converter since my PC does not have any legacy serial ports. The eBay cable has the USB to serial converter built in. I should note that after I had purchased the cable, I bought a VX-7RB and wound up having to get a standalone USB to serial adapter in order to program the VX-7RB.

Regarding the other question posted about Linux drivers, I have not tested it on Linux but there are RedHat 7.0/8.0/9/0 drivers available at http://www.prolific.com.tw/eng/downloads.asp?ID=31 and a Google search on "pl-2303 linux" turns up quite a few hits including some source code. YMMV!

I could be wrong (happens all the time), but on the web page that your URL goes to, it appears that there is only one interface cable offered, and then you buy the USB to serial adapter that they offer (RTS-03) to make it do what you want. If you have found a cable that goes directly USB to rig, then I'll buy the cable you have.

17933. FT 897 and Coupler Control

Yahoo group: FT897 (2007)
Date: 2007-03-22 01:49:38 UTC
From: vk6yig
Topic: 17933 Message: 17933

Hello Group

Just joined the group this week.
Has anyone in the group monitored the communications between an FC30/FC40 and the FT897D?
I wish to homebrew (instead of buy) an antenna coupler for use with my FT-897D and would like to be able to use its inbuilt antenna tuner control capability in lieu of the OTT style option used for non generic couplers.
To utilise this capability requires knowledge of the Format and the Commands that are passed between the FT 897D and an external controller (FC 30/FC 40) via the CAT/ Linear jack.
Not having access to either of these antenna controllers to enable monitoring of the communication I am humbly seeking these details from anyone who may have already been down this path.

73,
Alan

HD -

Welcome to the group!!!

I think you'll find this group to be quite knowledgeable and helpful. I agree with Gene's assessment about portable vs. mobile use, and it really comes down to how you are planning on using the radio, especially for those times when it won't be used for a base station. The FT-897D doesn't lend itself to mobile use, since it is fairly large and doesn't have a detachable head like the IC-7000. But it is better suited to portable use due to its construction and the ability to add on-board batteries or a power supply.

If your primary concern is base station use, the IC-7000 has more features, but is also more costly.

Have you downloaded the manuals for each? That might give you some more information.

This new Yahoo format is very difficult to use. We used to be able to just scroll through the headings and look at things of interest. Now one is forced to read everything and one cannot just copy one comment to file.

This new format is sure discouraging me from using the otherwise excellent group. Does anyone have influence over what Yahoo is doing? I for one much prefer the older way of doing the group. Again, i am not using the group as much as i used to and that is too bad, but there is more to life than reading every post-like operating!

Hope the moderator or someone can influence a change back.

Date: 2007-03-22 11:56:12 UTC
From: Ken Bandy
Topic: 17930 Message: 17940

Peter, I have read where some folks have adapted the mic connection to be able to pull another CAT line off. Unless you already have the FC-30, I would recommend against that tuner. I bought one with my FT-897D, and soon after replaced it with the LDG AT-897. A much more "forgiving" tuner, and it only uses the CAT connection for power, so you can use it for what you want.

Subject: [FT897] CAT cable with FC-30

Is there a way to be able to use the CAT cable connected to your computer so you can
control the radio from your computer, and still use the CAT interface for the FC-30
tunner?

Thanks.

Hi,

SO what software is available to control the FT-897 in Linux or OS X?
I've thought of getting a mini-mac for the shack but hesitated
because I didn't know of software to control the radio.

From: OC Radicic
Topic: 17904 Message: 17943

There was some mention of rig control...I recommend trying Ham Radio Deluxe... It offers rig control from a computer, logbook, contact mapping and will also allow remote control through the internet. The 897D is one of the listed rig options in setup and was fairly intuitive to set up...although I am still learning what it will do. More on it and free download is at http://hrd.ham-radio.ch/

Hi

Hamlib works - I was pleased to demo it at a RadioRally near here last October.. Admittedly it was via the serial cable and not my USB Tiny interface.

Once your talking to the '897 via Hamlib there's a selection of other programs which talk to hmalib. gMFSK is one quite nice app - I believe someone else has taken that project a stage further and added more capability in.

There is a rig control but I can't remember it at the moment - this search should kick up some results though:
http://www.google.co.uk/search?q=hamlib+ft897
(I guess .com would be better for you though)

17947. F.S.: SignaLink SL-1 Interface

Yahoo group: FT897 (2007)
Date: 2007-03-23 00:45:06 UTC
From: hamguy772002
Topic: 17947 Message: 17947

Hi All,

I have a like new SignaLink SL-1 Interface for sale including the SLASSY cable accessory kit plus a Power-Poled power cable, instruction manual, and a CD with multiple software for digital modes. the jumpers are set for the FT-817/FT-857/FT-897, but can be reset for many other radios. If you use any of these three models, all you have to do is hook up the cables, install your favorite software and go.

I'll ship anywhere in ConUS via Priority Mail for $60 (no paypal).

Email me OFF list at ke2mm@... if interested. See:

17955. Difference between FT897D and FT857 for digital modes

Yahoo group: FT897 (2007)
Date: 2007-03-22 11:08:04 UTC
From: kc9hax
Topic: 17955 Message: 17955

I am looking to buy, and may use the radio for digital modes. Looking at the specs and posts. It seems that the FT897D would have a better heat sink and cooling fans to handle the higher duty cycle of digital. Would there be any other advanatages of the FT897D.

17960. Mailings

Yahoo group: FT897 (2007)

From: Mel Minnick
Topic: 17960 Message: 17960

The mailings of QST & World Radio are early here. I have also seen the issue in HRO here locally.

Keep in mind that Nenad, 9A5AN the author, does monitor this group. Maybe a bit busy at this time? He did list his e-address as 9a5an@...<mailto:9a5an@...> and his snail-mail as [1. Vidovcica 11a, 10000 Zagreb, Crotia].

In the files of this group is a similar set-up but without the PPT option on a foot switch by Juan-KG4FSN, His response as follows.

Hi
If you don't need the PTT foot switch and to connect an electret mike you may
wish to look to the CAT Interface I made. It is at the Pictures section of this
list under my call sign KG4FSN.
If you have any problem in getting it please send me an e-mail and I will
forward you a copy of the schematic.

Send it in for repair!
I sent mine in because I noticed it was only putting out about 30 watts on VHF with 50 selected. So, I ran it through the paces. I checked out the UHF, VHF and HF side of the power out. Dismal results. I had the problem on VHF, and on UHF, the power out was only 15 watts. When I selected anything less than 20 watts, there was no power out at all.
On HF, the radio ran fine at 100 watts, but I did notice some drop outs in the output. I was also watching my current draw while transmitting and it dropped off whenever the the power drop occurred. I selected lower power levels in HF and had the same type of problem there as on VHF and UHF. At less than 50 watts selected, I had no power out at all.

I contacted Yaesu and they said I should send it in. That was on the 6th of this month. They got it on the 8th and still have it waiting for parts. So far, they have changed out 2 FETs and an IC. They are still waiting for parts before they check it out and send it back to me. Serial number 6M77XXXX. Same series? Could be another week.

Not much help,

But, I've seen the results of a lightning strike to an Rx vertical on the foremast of a tanker (we were exiting Beaumont / Port Arthur at the time).

Aerial looked like a palm tree afterwards - fortunately no other damage was done.

Lightning CAN have a devastating effect on GRP but at other times seems to have little or no effect - possibly it's the heating effect.

From: Peter Short
Topic: 17726 Message: 17966

Thats right Graham, I used to think 1KW was QRP!!

I never sailed with the Commandant, but trained on it (80M who said that??), but have sailed with Conqueror(2x 3-500 's) and ST14/600 (4 x 4CX250Bs) and various Japanese TX's one of which could be modded for a good 2.3KW on HF, but of course I never did!!

More Power to the Elbow!!

As you say them were the days, and they do end.

17967. Adding a 222 Transverter inside the FT-897

Yahoo group: FT897 (2007)
Date: 2007-03-25 17:33:53 UTC
From: Ronald Bergantzel
Topic: 17967 Message: 17967

HELLO ! I just finished posting a new file showing a
neat installation of a 222 transvsrter into the
battery area of the 897..... This is an article done
by one of the locals here in the Minneapolis, Mn area
- Jon W0ZQ. It is an article he wrote for the Central
States VHF Society - Jon W0ZQ has given me permission
to post this article. He also has kept the copyrights
to the article (so there is no legal hassles) ... I
am probably going to install a 1296 transverter into
my 897 in the same fashion..... Enjoy the article .
73, Ron KA0RYT

Yes. Ham Radio Deluxe. It is fantastic with the 897. Many of the menu-driven options are right in front of you, and it has a good, ADIF compatible logging system to boot. Recommended. Run your rig at at least 9600 baud.

Do a Google search for "Ham Radio Deluxe". I asked the same question
and got that as the answer. Not tried it yet but intend to.

HRD is an amazing program that takes some time to master...For just rig control I prefer Virtual Legacy Radio... http://ok1fig.nagano.cz/vlr_overview.htm Is is fairly new and is being expanded almost monthly...Its really great for casual chit chat from band to band...No more fooling with the small hard to see buttons on the rig...

17973. Re: Computer control software for FT-897d

Yahoo group: FT897 (2007)
Date: 2007-03-25 20:56:11 UTC
From: Dave Bernstein
Topic: 17968 Message: 17973

The DXLab Suite will control your FT-877 and is completely free; its available via www.qsl.net/dxlabsuite.com . Members of this Suite and their capabilities are summarized below.

73,

Dave, AA6YQ

Commander controls HF transceivers supplied by Icom, Kenwood, TenTec, Yaesu, Alinco, Elecraft, FlexRadio, and Kachina (screenshot). It

- permits definition of up two 2 sub-bands per band, and highlights out-of-segment operation

- provides 10 banks of 10 memories, each specifying frequency, mode, and filter

- switches among four transceivers with a mouse click, or automatically based on frequency

- displays DX spots in a zoom-able bandspread if SpotCollector is running

- displays frequency-dependent control settings for devices like antenna tuners and amplifiers

- supports additive and subtractive transverters for the 6m, 4m, 2m, and 70cm bands

- supports User-defined Command Sequences

- monitors and optionally displays messages between your PC and transceiver

- automatically interoperates with DXKeeper, PropView, SpotCollector, and WinWarbler

DXView displays location information and controls antenna rotators. Given a callsign, callsign fragment, or prefix, DXView displays

- the name of the associated DXCC entity, and a map of the country

- local time

- latitude/longitude, gridsquare, and distance in miles or kilometers

- the DXCC entity's continent, CQ zone, and ITU xone

- short path and long path beam headings

- DXing award progress (if DXKeeper is running)

- sunrise and sunset times for the next 30 days

DXView displays a world map that

- shortpath and longpath beam paths to the DX location

- the solar terminator

- the auroral oval boundary (if SpotCollector is running)

Rotators and controllers supplied by Alfaspid, ARSWIN, Heath, Hygain, LP-Rotor, M2, Prosistel, Rotor-EZ, SARtek, TIC, and Yaesu are supported. DXView automatically interoperates with DXKeeper, PropView, SpotCollector, and WinWarbler.

DXKeeper logs QSOs, tracks awards, generates QSLs, and synchronizes with both LotW and eQSL.cc (screenshot). . It can extract name, address, and location information from QRZ.com (using Pathfinder), or via any of the 3 major callbook CDROMs:

- Radio Amateur's Callbook

- Buckmaster HamCall

- QRZ

DXKeeper tracks progress and generates progress reports for the following awards:

- DXCC

- CQ DX Marathon

- Maidenhead grids

- Maidenhead fields

- TOPLIST

- VUCC

- IOTA

- WAC

- WAS

- WAZ

- WPX

DXKeeper can print QSL cards. and QSL Labels, addresses envelopes, and prints address labels. It independently tracks hardcopy QSL, eQSL.cc, and Logbook of the World (LotW) confirmation for each QSO. DXKeeper can upload QSOs to eQSL.cc and LotW, download QSLs from

eQSL.cc and LotW, and automatically updates your log to reflect confirmations from these two services. It identifies QSLs required for DXCC submission, and generates the required documentation. DXKeeper can import and export ADIF-compliant log files. DXKeeper automatically interoperates with Commander, DXView, Pathfinder, SpotCollector, and WinWarbler. It can log QSOs in realtime from MixW, MMSSTV, MMTTY, MMVari, and MultiPSK.

WinWarbler supports PSK31, PSK63, RTTY, CW, and phone operations:

- simultaneously displays PSK transmissions on three separate frequencies

- simultanteously decodes all in-band PSK transmissions, displaying extracted callsigns in a "stations heard" window whose entries can be double-clicked to QSY

- provides two independent means of sending and receiving RTTY signals, enabling diversity decoding or simultaneous decoding of a DX station and its pileup: via soundcard, using JE3HHT's MMTTY engine, and via an external RTTY modem, such as a Kantronics KAM or Timewave PK232

- sends CW via serial port modem control signal, parallel port data signal, an external WinKey keyer, an external modem, such as a Kantronics KAM or Timewave PK232

- provides a phone voice keyer with up to 32 messages

- supports 2 banks of 16 macros; macro definitions can be loaded from files on mode change

- GPS interface makes position, course, and speed available via macro substitution commands

- automatically interoperates with Commander, DXView, DXKeeper, SpotCollector, and Pathfinder

- exports an ADIF log for use with any ADIF-compatible logging applications

SpotCollector maintains a spot database that combines DXing spots of the same station on the same frequency and mode into a single entry (screenshot). It collects spots from up to four telnet-accessible DX Clusters, the DX Summit spotting network, and a local PacketCluster (via a TNC). Each spot database entry contains the following items:
- callsign
- time of the first spot
- time of the most recent spot
- the station's DXCC entity
- frequency
- mode of operation
- spot notes

- QSX frequency (extracted from spot notes)
- grid square (extracted from spot notes)

The spot database can be sorted and/or filtered by any item or combination of items, and can highlight spot database entries for stations that represent new DXCC entities, entity-bands, and/or entity-modes based on the user's DXKeeper log and award objectives. A built-in web server makes it possible to display spot databased entries from any networked-connected device that hosts a web browser. SpotCollector also captures WWV spots, and graphically displays their values over the most recent solar revolution (screenshot). . It automatically interoperates with Commander, DXView, DXKeeper, Pathfinder, PropView, and WinWarbler.

PropView predicts and monitors HF propagation:

- Computes and graphically displays propagation forecasts to a specified location, shoing band openings across the UTC day

- Monitors the NCDXF/IARU International Beacon Network

- monitors individually selected beacons

- monitors all beacons on a specified band

- monitors all beacons near a specified bearing

- can QSY your transceiver to the current beacon's frequency (if Commander is running)

- can display the current beacon's location on a world map (if DXView is running)

- can rotate your antenna to the specified bearing (if DXView is running)

PropView automatically interoperates with Commander, DXView, DXKeeper, SpotCollector, and WinWarbler.

Pathfinder locates QSL information from more than 100 web-based sources of information (screenshot)d. It provides 12 dedicated search buttons, each assignable to a specific information source. Pathfinder determines a specified callsign's DXCC entity, and provides one-click access to the appropriate country-specific online callbook. It automatically interoperates with DXKeeper, DXView, and SpotCollector.

The DXLab Launcher makes it easy to install, upgrade, and control DXLab applications. You can

- start or stop a group of DXLab applications with a single mouse click

- minimize or restore the main windows of all running DXLab applications with a single mouse click

- start, minimize, restore, or stop individual DXLab applications

- view at a glance the state of all DXLab applications

- determine whether new versions are available, and upgrade a DXLab application with a single mouse clikc

- save a DXLab application's Windows Registry settings to a specified file

- restore a DXLab application's Windows Registry settings from a specified file

- switch all DXLab applications from one set of Windows Registry settings to another (switch between multiple users, or multiple activity styles)

17974. Re: Computer control software for FT-897d

As others have mentioned HRD and Virtual Legacy Radio are good.
However, if you also want to program the memories then you will need to
use a seperate program. I have found FTBasicMMO (see
http://www.g4hfq.co.uk/mmohelp/mmohelp.htm) to be an excellent program
for this purpose. It isn't free but it is worth the low price.

17975. Battery Power.

Yahoo group: FT897 (2007)
Date: 2007-03-26 10:50:34 UTC
From: Stuart
Topic: 17975 Message: 17975

My wonderful wife has just bought me an FT897D for my birthday.
Bragging over, I have a question to ask the group.

I have the two FNB78 internal batteries fitted to the radio. Is it possible to use an external 13.8v power supply via the 6 pin plug while these are fitted and/or are being charged?

I can find nothing in the manual about this, but naturally I would like to know before I went ahead and did something daft.

Thanks,
Stuart, GD0OUD.

This might be new to you but my recommendation is that you cut the power lead from the charger and install an Anderson power pole. Then you can use your radio and charge it at the same time from your power supply, without relying on the internals of the radio. Actually if you power everything by Anderson poles your life will be much simpler and you can easily interface with others who are using these connectors.

Incidentally I am not fully converted yet but still working on it.

Here is the one that I purchased.

Hi Stuart,

No problem, there is no internal connection between the power socket and the batteries, the batteries are taken out of use when 13.8 volts is present on the connector. You can leave the power on when charging the batteries and continue to use the radio.

Also you can Use one battery whilst charging the other if you like.

Hope this helps

Regards

Andrew - G7MNS

James,

Are you saying that you can simply put 13.8 V into the charge plugs and do without any charger?

That's an interesting consideration! Basically are you floating the power supply across the battery line going into the radio?

From: David Zahler
Topic: 17975 Message: 17984

Stuart,

While I agree with James, Anderson Power Poles are the way to go for all 12 volt supplies, The power supplied to the batteries for charging is not 12 volts. Leave the charger cable intact.

The answer to your question is that you can charge the batteries while operating off of an external 12 volt supply.

From: jurgen vogel
Topic: 17975 Message: 17985

You might dammage the batteries doing it that way. Remember the battery packs have 11 cells, for a proper charge you need a 15 volts supply, otherwise they never ever reach full charge. Thats the reason you need the special charger from Yeasu, it actually cuts out into trickle charge at 15.1 volt. Good look

James,

Are you saying that you can simply put 13.8 V into the charge plugs and do

without any charger?

That's an interesting consideration! Basically are you floating the power

supply across the battery line going into the radio?

73,

Gordon, W2TTT

I am not sure about that. I think the batteries are charged at a higher voltage then 12 volt.

What I meant was don't charge your batteries while using the same battery it causes lots of charging issues.

However if you plug the charger, the 12 volt side into the anderson power pole distribution center then connect the radio to the anderson power distribution. You can have two independent circuits one to power the radio the other to charger the batteries. This way your charging your batteries independent of the use of the radio.

Does anyone see an issue with this?

17987. Virtual Legacy Radio, new version 1.0.8.0

Yahoo group: FT897 (2007)
Date: 2007-03-27 07:57:38 UTC
From: ok1fig
Topic: 17987 Message: 17987

It is a pleasure to announce a release of new version of Virtual Legacy Radio CAT software.
For more details and download visit:
http://ok1fig.nagano.cz/vlr_overview.htm

For the list of changes see the table at the bottom of the page.
To keep you current settings don't uninstall, install over an existing installation.

Besides others, it fixes problems of users with Window 95/98.
It also works better with FT-847.

This time my thanks belong mainly to:
Maki, S54M
Mike, VA3MCT

Any comments and suggestions are highly appreciated.

73, Petr, OK1FIG

I had the exact problem, 100 watts one day and 30 on all bands 40 and higher after that. I had to send it in 6xx serial puchased Oct of last year. They had it for two weeks and replaced a 'slew' of parts. Seems okay now. I wonder if there is an issue with that production run?

17989. Re: [FT897] Re: Low power output

Yahoo group: FT897 (2007)
Date: 2007-03-28 19:54:31 UTC
From: Tim Lyons
Topic: 17867 Message: 17989

Could be. Mine is still in the shop. Today they "fessed up" and said the parts they had to order were coming in from Japan. So far, Yaesu has had the radio for 3 weeks and they don't know when the parts will be in from Japan. Parts count for replacement is currently at 3, with something that has to come from Japan to be the 4th.

I only had the radio (shipped new from Gigaparts) for 2 days, but because of the transit time for shipping, it went past the week that they get from Yaesu. So, I couldn't return it to Gigaparts for a replacement. It had to go to Yaesu. So, now instead of getting a new radio for a new radio price, I will (eventually) get a radio that has been re-worked. Yaesu will not even entertain giving me a new radio. They want me to wait. Maybe I should have bought the 7000 instead?

Hi Folks!

I am selling my FT-897, with its two internal batteries, the two part charger, two microphones (stock and the cool one.I forget the model), and an LDG AT-897. Please make an offer, though a trade involving an IC-7000 is welcome.

FYI, I have only one Yaseu radio and several ICOM rigs including an IC-7000 in my truck. My eyesight is not what once was and I want to limit the number of rigs that I need to memorize in order to run.

I am selling my FT-897, with its two internal batteries, the two part charger, two microphones (stock and the cool one.I forget the model), and an LDG AT-897. Please make an offer, though a trade involving an IC-7000 is welcome.

FYI, I have only one Yaseu radio and several ICOM rigs including an IC-7000 in my truck. My eyesight is not what once was and I want to limit the number of rigs that I need to memorize in order to run.

Hi Folks!

I am selling my FT-897, with its two internal batteries, the two part charger, two microphones (stock and the cool one.I forget the model), and an LDG AT-897. Please make an offer, though a trade involving an IC-7000 is welcome.

FYI, I have only one Yaseu radio and several ICOM rigs including an IC-7000 in my truck. My eyesight is not what once was and I want to limit the number of rigs that I need to memorize in order to run.

Stuart: I only have one of the batteries but I have charged it
while operating the rig on my power supply in the shack. Havent
noticed any problems and have had the rig for 3 years.
Charge my batteries from 12v supply and also have the A/C adaptor
unit to charge batteries.
Heads up: I recommend pulling the batteries if you are going to use
it mobil as the temps in a vehicle go way up in the summer sun. This
will shorten the life of the packs if they are installed. The temps
are critical according to the info that comes with the batteries.

The TCXO of the 897 would also help prevent frequency drift during the higher duty cycles of digital. You didn't mention what other radio you were comparing it to so it's hard to list other advantages.

18042. Where are all the menus?

Yahoo group: FT897 (2007)
Date: 2007-03-27 23:59:11 UTC
From: dlgillen
Topic: 18042 Message: 18042

Hello Everyone,
I'm new to the group. I have been a ham for about a year and upgraded to general earlier this month.

I have purchased the FT-897D and th AT-897. I also got the FP-30 for power because I will use this rig as a base. As I work through the learning curve I may ask for help if I can't find the answers by searching past posts....:-)

I have been able to get things up and running but I have noticed when looking through the menus I dont see all of the menu items. The numbers will jump from No-030 to No-033 then No035. Looking at the manual I should have a No-031.

Is this normal? Or do I not have something set properly...
Thanks in advance...

Date: 2007-03-27 17:53:21 UTC
From: Jerry Karlovich, KD5OM
Topic: 17975 Message: 18050

I've just aquired my FT-897D along with the internal battery packs, charger controller and AC adapter. I've been reading this tread and hoping to find an answer of the original question without suggestions of taking the wire cutters and soldering irons to my newly aquired toys.

Do I understand it correctly that if I have the batteries installed in the radio and apply 13.8 volts to the 6 pin molex like power connector, no charge current will find it's way to the batteries? The only way to charge the batteries is through the round battery connectors via the charge controller? That's ok with me. That's what I want. I want to be able to operate on the 13.8 volt supply knowing my batteries are not being effected.

The TCXO of the 897 would also help prevent frequency drift during the higher duty cycles of digital. You didn't mention what other radio you were comparing it to so it's hard to list other advantages.

From: Jerry Karlovich, KD5OM
Topic: 17975 Message: 18061

I've just aquired my FT-897D along with the internal battery packs, charger controller and AC adapter. I've been reading this tread and hoping to find an answer of the original question without suggestions of taking the wire cutters and soldering irons to my newly aquired toys.

Do I understand it correctly that if I have the batteries installed in the radio and apply 13.8 volts to the 6 pin molex like power connector, no charge current will find it's way to the batteries? The only way to charge the batteries is through the round battery connectors via the charge controller? That's ok with me. That's what I want. I want to be able to operate on the 13.8 volt supply knowing my batteries are not being effected.

18063. Where are all the menus?

Yahoo group: FT897 (2007)
Date: 2007-03-27 23:59:11 UTC
From: dlgillen
Topic: 18042 Message: 18063

Hello Everyone,
I'm new to the group. I have been a ham for about a year and upgraded to general earlier this month.

I have purchased the FT-897D and th AT-897. I also got the FP-30 for power because I will use this rig as a base. As I work through the learning curve I may ask for help if I can't find the answers by searching past posts....:-)

I have been able to get things up and running but I have noticed when looking through the menus I dont see all of the menu items. The numbers will jump from No-030 to No-033 then No035. Looking at the manual I should have a No-031.

Is this normal? Or do I not have something set properly...
Thanks in advance...

By way of introduction, I'm new to this group and the new owner of a FT897D last Saturday. I have the FAQ that describes the mod to get it on the MARS frequencies, however, only the 7 and 8 (counting from the rear) pads are populated on my board and I find myself wondering if I should proceed or is there something different about these later boards as compared to the one that KA2SNF did his mod on.

Stuart: I only have one of the batteries but I have charged it
while operating the rig on my power supply in the shack. Havent
noticed any problems and have had the rig for 3 years.
Charge my batteries from 12v supply and also have the A/C adaptor
unit to charge batteries.
Heads up: I recommend pulling the batteries if you are going to use
it mobil as the temps in a vehicle go way up in the summer sun. This
will shorten the life of the packs if they are installed. The temps
are critical according to the info that comes with the batteries.

Hi Folks!

I am selling my FT-897, with its two internal batteries, the two part charger, two microphones (stock and the cool one.I forget the model), and an LDG AT-897. Please make an offer, though a trade involving an IC-7000 is welcome.

FYI, I have only one Yaseu radio and several ICOM rigs including an IC-7000 in my truck. My eyesight is not what once was and I want to limit the number of rigs that I need to memorize in order to run.

18091. FT897D and the MARS Mod

Yahoo group: FT897 (2007)
Date: 2007-03-29 02:35:09 UTC
From: Curt Givens
Topic: 18048 Message: 18091

By way of introduction, I'm new to this group and the new owner of a FT897D last Saturday. I have the FAQ that describes the mod to get it on the MARS frequencies, however, only the 7 and 8 (counting from the rear) pads are populated on my board and I find myself wondering if I should proceed or is there something different about these later boards as compared to the one that KA2SNF did his mod on.

18092. Where are all the menus?

Yahoo group: FT897 (2007)
Date: 2007-03-27 23:59:11 UTC
From: dlgillen
Topic: 18042 Message: 18092

Hello Everyone,
I'm new to the group. I have been a ham for about a year and upgraded to general earlier this month.

I have purchased the FT-897D and th AT-897. I also got the FP-30 for power because I will use this rig as a base. As I work through the learning curve I may ask for help if I can't find the answers by searching past posts....:-)

I have been able to get things up and running but I have noticed when looking through the menus I dont see all of the menu items. The numbers will jump from No-030 to No-033 then No035. Looking at the manual I should have a No-031.

Is this normal? Or do I not have something set properly...
Thanks in advance...

18093. Re: Battery Power.

Yahoo group: FT897 (2007)
Date: 2007-03-27 17:53:21 UTC
From: Jerry Karlovich, KD5OM
Topic: 17975 Message: 18093

I've just aquired my FT-897D along with the internal battery packs, charger controller and AC adapter. I've been reading this tread and hoping to find an answer of the original question without suggestions of taking the wire cutters and soldering irons to my newly aquired toys.

Do I understand it correctly that if I have the batteries installed in the radio and apply 13.8 volts to the 6 pin molex like power connector, no charge current will find it's way to the batteries? The only way to charge the batteries is through the round battery connectors via the charge controller? That's ok with me. That's what I want. I want to be able to operate on the 13.8 volt supply knowing my batteries are not being effected.

The TCXO of the 897 would also help prevent frequency drift during the higher duty cycles of digital. You didn't mention what other radio you were comparing it to so it's hard to list other advantages.

18097. [FT897] FT-897 Package for Sale!

Yahoo group: FT897 (2007)
Date: 2007-03-28 22:03:26 UTC
From: J. Gordon Beattie, Jr., W2TTT
Topic: 17867 Message: 18097

Hi Folks!

I am selling my FT-897, with its two internal batteries, the two part charger, two microphones (stock and the cool one.I forget the model), and an LDG AT-897. Please make an offer, though a trade involving an IC-7000 is welcome.

FYI, I have only one Yaseu radio and several ICOM rigs including an IC-7000 in my truck. My eyesight is not what once was and I want to limit the number of rigs that I need to memorize in order to run.

Stuart: I only have one of the batteries but I have charged it
while operating the rig on my power supply in the shack. Havent
noticed any problems and have had the rig for 3 years.
Charge my batteries from 12v supply and also have the A/C adaptor
unit to charge batteries.
Heads up: I recommend pulling the batteries if you are going to use
it mobil as the temps in a vehicle go way up in the summer sun. This
will shorten the life of the packs if they are installed. The temps
are critical according to the info that comes with the batteries.

18123. FT897D and the MARS Mod

Date: 2007-03-29 02:35:09 UTC
From: Curt Givens
Topic: 18048 Message: 18123

By way of introduction, I'm new to this group and the new owner of a FT897D last Saturday. I have the FAQ that describes the mod to get it on the MARS frequencies, however, only the 7 and 8 (counting from the rear) pads are populated on my board and I find myself wondering if I should proceed or is there something different about these later boards as compared to the one that KA2SNF did his mod on.

From: ki4hlw
Topic: 17955 Message: 18125

The TCXO of the 897 would also help prevent frequency drift during the higher duty cycles of digital. You didn't mention what other radio you were comparing it to so it's hard to list other advantages.

Hello Dan,

You have to set expanded menus (menu 1) to get all the available menus.

I suspect it's not a Yahoo! problem. I'm not getting dupliate emails.
Perhaps one of the servers that the email routes through between Yahoo!
and those who are getting duplicates is hosed up?

Bryan:
Nope, definitely a Yahoo! problem. I personally had over 400 E-Mails this morning, mostly Yahoo duplicates. From the Groups Team site...

"We're aware of the duplicate message bug that has been affecting groups today and are working to resolve the issue (a side effect of this bug is that some messages are also being delayed). We have actually pushed two fixes already, but we are aware that some groups are still experiencing the problem and that more needs to be done to fully resolve the issue."

Looking in our server logs it looked to me like Yahoo's servers were taking incoming mail but not indicating to the sending systems that they had successfully received it. The net result would be that the sending servers would keep trying, the messages would keep getting duplicated on Yahoo, and the sending server would eventually send a message back to the sender saying it couldn't deliver the E-Mail -- all of which I was seeing. Seems to be fixed now, at least with all the groups I'm involved with. So, back to your regular FT-897 discussions.

You've probably heard this by the time you get this reply, but it's a Yahoo server problem. My morning downloads of email are usually in the 20-30 range, this morning I had 698. After breakfast I tried again and it looks like they've fixed it, no huge numbers and no multiple copies. Cross y'er fingers(G).

I've had the FT-897 with the two battery packs installed since 2003. Yes you can charge the battery packs while operating the radio off an external 13.8 volt supply. Being a digital DC to DC converter, the battery charger can be noisy though on some frequencies. I added some snap on ferrites to its cord to help reduce this.

Supplying 13.8 VDC to the FT-897 disconnects the internal powerpacks from supplying power to the radio. The display indicates this by extinguishing the battery indicator. Likewise, you can run off one of the battery packs while charging the other. It's funny if your external power is lost while battery packs are installed. The radio blanks and then turns on a second later as the internal battery packs take over. Likewise once external power is restored

BTW, I built a second power cord for the charging adaptor that allows me to use the same separate external power supply to provide power to the charger and the rig simultaneously. The charger supply cord can be of smaller guage wire as it doesn't draw much. Both cords connect to the power supply via Anderson PowerPoles.

Hope that helps from someone who has actually done what you suggest.

Your analysis is correct. The external power connector on the back
of the FT-897 does not charge the batteries. Only a charger
connected to the round battery connectors does. It needs to provide
something around 14.6 Volts.

>extinguishing the battery indicator.

I have a brand new (just bought it a couple of weeks ago) FT-897D and when I plug the radio into 13.8vdc via the 6 pin connector the battery indicator (the orange LED) stays lit like it's still using the battery, the battery indicator next to the voltage display goes out. I have verified that it is NOT using the battery and it is using the supply voltage.

I can switch to the supply voltage by just plugging in the 6 pin connector, However, if I unplug the 6 pin connector the radio turns off as it switches to batteries.

hello
does anyone have the molex part numbr / model for the female chasis connector used on the 897d- called yaesu couldnt find the connector or assembly

if you have a source i would appreciate it
i am making a male female extension cord so i can plug the internal supply mounted on the bottom of the bench to supply the rig so i dont have to keep removing batteries when i use in
fixed.

i also want to attach a second female connector to the extension cable so i can plug in the cd
24 to charge the internal batteies while using the internal supply as an external source.

looked through mouser but wasnt certain
thanks

I went a slightly different route. I put a powerpole on the output of my power supply then put power poles on everything. I can then put a power pole splitter on and use the power supply to power other things as well.

You could also buy the AC charger for the batteries which is nice and small so can be carried with you to charge the batteries when you out and about.

18152. High SWR Protection Question

Yahoo group: FT897 (2007)
Date: 2007-03-30 01:14:01 UTC
From: ke7hge
Topic: 18152 Message: 18152

My question to the group has to do with the level of protection given to the finals in the 897D. I was talking with one of my ham buddies over coffee this morning, and he said that modern radios have enough built in protection so that if a radio is run with a high SWR, the radio will just not transmit, thereby saving the finals from going up in smoke. While I think that is a great idea, I remain skeptical. Is my friend "blowing smoke" or is the protection in modern radios "that good"? I am speaking directly to the 897D.
Thanks in advance, Ken KE7HGE

Hello all,
I am thinking of purchasing a FT 897 and was interested in how
difficult or easy it would be to use on RTTY and PSK31.

Will it need an interface or can it be done directly from rear jacks.

Topic: 18048 Message: 18157

Curt,

Follow the mod to yield jumpers on pads 1006, 1007, 1008, and 1009. remove jumpers from pads 1001 and 1002.

The jumper numbering is strange.

It is in groups of 3, in descending order.

rear of rig

1007
1008
1009

1004
1005
1006

1001
1002
1003

This info from the Mod sites on the net, and I have performed it on a FT-897D and FT-857D in the past week.

I sent email request for mod to Yaesu, but so far they have been un-responsive.

Be careful, use magnification, and check for un-wanted solder bridges before powering up rig.

Do a master reset, and you will be good to go.

While it's better to use an interface between the pc and the 897 (separate grounds and ptt control via serial or usb) it can be done simply sending the audio signals directly (or with some resistors to attenuate the levels) through two shielded wires joining the sondblaster audio in and out with the respective out-in pin on the data rear panel mini-din of the rig. The ptt control is not really needed because you can set the 897 to use the menu set digital vox to switch to tx when it sense the audio in coming from the pc audio.

It is very easy to interface for the digital modes. A cable that has stereo jacks for audio in/out on one end, and the appropriate DIN connector at the other end is all you need.

Yeah, the manual is confusing about those LED's. The battery indicator and supply voltage indicators on the LCD display are a more accurate representation of where the radio is getting it's power at the moment. You can also confirm it by the output power. If it is actually running off the internal batteries, the output power is limited to 20 watts.

> I can switch to the supply voltage by just plugging in the 6 pin

Correct. The bottom line is that if 13.8 VDC is applied to the external power connector, the radio could care less if a battery is installed.

I concur. Also, the rig has seperate mic gain settings for the digital
modes, which allow you to have different ones when using a sound card
or when you're using voice. This helps prevent overdriving on PSK-31.

The SWR protection is there mainly to provide protection from SHORT TERM high SWR. It is NOT "Idiot Proof", and sustained attempts at high-power operation into a badly matched/shorted or open antenna are likely to result in damage to MANY radios! If in doubt as to the quality of an antenna match, start with 50% or less CW/FM output power, and if needed, make your tuning adjustments at the LOW POWER setting, before returning to high power. All transmissions that are done under mismatched (High SWR) conditions, should be kept SHORT, preferably to no more than 10 seconds! Observing this procedure, until you obtain an SWR of 2 to 1 or less, will greatly LESSEN chances of failure. Best 73, KC3VO-Bob Curry

Thanks for your input on this issue. The answer the majority of you gave was more or less what I expected. It sure is nice to have "momentary protection" from stupid mistakes built in to new technology. I still remember filling the cab of a pickup truck with white smoke when I connected the power to the radio I thought was turned off. I can smile and laugh now, but not on that day.

18170. DSP CW Peaking Filter - Pg 27

Yahoo group: FT897 (2007)
Date: 2007-03-31 03:44:41 UTC
From: mrmsudawgs
Topic: 18170 Message: 18170

Referencing the above page in my manual, I have tried setting my peaking filter. First the story - I was working on 40M one night and heard two stations calling CQ. They were not on the same frequency exactly but very close. I wanted to filter out the "Station A" so I could qso with "Station B". Their signal strengths were equal and I tuned to the frequency of Station B. However, pushing "DBF" filtered out the wrong station?

Is there a way to choose which station one wants to receive and or filter? If so, How?

Tks

mrmsudawgs,
First set menu 027 (CW Pitch) for the audio tone you
prefer to hear for CW (400 - 800 Hz). Then use the
tuning LED (Item 21 on page 13) to tune in the desired
CW station center frequency in CW Mode. Then activate
the DBF filter. If you still hear two stations, hold
the DBF key to activate menu 045 and adjust for narrow
bandwidth. At 60 Hz you should not hear much
interference from station B.

I had the same problem with my 857D. I accidently keyed up on the UHF band without an antenna connected. This resulted in one of the switching diodes getting blown out in the TX UHF filter section - this resulted in no power out on UHF. The fix was easy - about $1.00 for the diode from Yaesu.

buddies over coffee this morning, and he said that modern radios have
enough built in protection so that if a radio is run with a high SWR,
the radio will just not transmit, thereby saving the finals from
going up in smoke. While I think that is a great idea, I remain
skeptical. Is my friend "blowing smoke" or is the protection in
modern radios "that good"? I am speaking directly to the 897D.

I don't know if the CT-62 is generic, but I have one
and they are nicely made. I haven't taken it apart
yet to see if there are any resistors or anything else
in there, and what the pinouts are, but electrical
isolation between the PC and radio are desirable. I
bought mine with the ADMS-4B software and I like that
too for managing the memories in the radio.

However you may also consider the West Mountain Radio
Rigtalk cable.

Or better yet the WMR Rigblaster Data Jack Plug 'n
Play. Combined with the optional CAT cable for radio
you will have a sound interface and rig control off
one USB port on your PC, no serial port required
because the data jack pnp has a serial port emulator
built in. It also has a jack for CW keying direct to
the CW jack on the radio.

Yahoo group: FT897 (2007)
Date: 2007-03-31 14:14:08 UTC
From: Joe B
Topic: 18170 Message: 18177

If you set the CW Pitch to a note that your ears prefer, it will help you to center your tuning on the desired CW station when two or more stations are close in frequency. The CW Pitch also sets the center frequency for the DBF filter.

I suspect that the reason you got the B station with the DBF filter, is that you were tuned to the B station, but your ears were listening to the A station before you activated the DBF filter.

From: Don Agro
Topic: 18178 Message: 18178

Hi,

Any idea of how the memory maps on the FT-857 and FT-897 differ from the FT-817 ?

The locations I am looking for are...

VFOA/B 0x55 on the FT-817
SPLIT 0x7a on the FT-817
POWER 0x79 on the FT-817

Thanks,

73 de Don Agro VE3VRW

It is a CT-62 if I am not mistaken and you probably need to go to HRO or somewhere that sells Yaesu gear to get it.

I can only suggest if you are not using the tuning box that DF1QQ has designed, that you try it out. Flip the switch, power drops to 5-10 watts, transmits a cw signal and you tune. Flip the switch back and you are ready to transmit full power on SSB or AM. For a cost of $10 it is a great addition to the radio. I am thinking about making it internal and putting it in one of the empty battery compartments. DF1QQ has definitely designed a time saver.

The CT-62 (or one of the other manufacture's similar cables) has circuitry in it to allow the PC to communicate with the radio and vice-versa. So, in a word, no, it's not a standard computer cable.

Hi Scott,

In MacLoggerDX I read the currrent VFO (A or B), the Split Status and the Power setting with those 3 locations in the FT-817 eeprom using the undocumented 0xbb read eeprom command - I just don't know those 3 addresses for the FT-857 and Ft-897.

Sent: Saturday, March 31, 2007 5:58 AM
To: FT897@yahoogroups.com
Subject: [FT897] Re: DSP CW Peaking Filter - Pg 27

Thanks for the reply but what does setting the CW Pitch have to do with the DBF filter? I've read the manual where it instructs me to do as you suggested and I've done that but I do not know WHY I am doing that. I mean, what is the relationship between CW pitch and how well the DBF is going to work?

Thanks,

Mike

No. Here is your problem. Be sure that menu 85 is turned to OFF. THEN
go to menu 20 and put it to CAT. Then make sure that your baud rate
setting is set to the same thing that you tell HRD. It will then work.
Guaranteed.

I have my cables mixed up; I was thinking of the other that carries the PTT, audio, COS and other signals used for packet and stuff. Sorry

Richard, N7TGB

It is a standard DIN connector, but you may not be able to find a cable that has all the wires you'll need. An alternative would be to buy just the connector and then some multiconductor wire and make your own.

It is a standard DIN connector, but you may not be able to find a cable that has all the wires you'll need. An alternative would be to buy just the connector and then some multiconductor wire and make your own.

18200. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2007)
Date: 2007-04-01 16:26:52 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 18200

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

18201. RE: [FT897] Re: High SWR Protection Question

Most of these just pump a signal into the AGC port, same as you do with a big linear. The 897 thinks it's way over power so throttles back.

Not too difficult to build yourself really.

Was first thought of/discussed on this and the 857 group many many months ago.

Subject: [FT897] Re: High SWR Protection Question

I can only suggest if you are not using the tuning box that DF1QQ has designed, that you try it out. Flip the switch, power drops to 5-10 watts, transmits a cw signal and you tune. Flip the switch back and you are ready to transmit full power on SSB or AM. For a cost of $10 it is a great addition to the radio. I am thinking about making it internal and putting it in one of the empty battery compartments. DF1QQ has definitely designed a time saver.

Hi Tom,

The auto-tuners of Yeasu has 2 negativ points:
- It can not tune antennas with a SWR greater than 3:1
- You can not use the Yeasu tuners AND control the FT897 with
your PC at the same time.

LDG-electronics has made the AT897 for the FT897.
This one can handle a SWR of 10:1 and can be used at the same
time to control your FT897 with a PC.
The negativ thing of it is cosmetical.

I use myself an auto-tuner of LDG, the Z100.

A CW-filter is very nice when you use CW or digital modes
(PSK31,RTTY..).
Then you have less problems with your AGC with (a) nearby strong
station(s).
I found it not worth to buy a SSB-filter (price/improvement).

With Google you wil find the program "Ham Radio Deluxe".
For control your rig with the PC you need also a CAT-interface cable
(Yeasu or homebrew).

To prevent ground loops use transformers and opto-couplers between
the FT897 and PC when you are use digital modes.

Peter
Thank you for the information. I have already been looking at the LDG brand of tuners. I am less concerned with cosmetics than performance. For function I assume there will be little or no difference between the at 897 and the at 100. I know where to start and will shortly be ordering one or the other. Thanks for the info on the control program as well. Hope to catch you on the air.

18204. Screwdriver antenna tuning SWR and PWR

Yahoo group: FT897 (2007)
Date: 2007-04-02 04:52:17 UTC
From: James Wilson
Topic: 18204 Message: 18204

----- Original Message -----
From: James Wilson
To: FT897@yahoogroups.com
Sent: Sunday, April 01, 2007 9:45 PM
Subject: Screwdriver antenna tuning SWR and PWR

I was recently told that the most effective way to tune a screwdriver antenna is to monitor the PWR out and "ignore SWR". I tried this and while transmitting at 5 watts in FM the PWR meter doesn't move.

Is there a way to configure the ft-897 to display relative power output?

Topic: 17046 Message: 18205

Hi Tom-
What works for me with the 897D -
LDG Z-11 Pro This is a great little tuner, can run months on 8 AA batteries installed inside the case, has 3-d memory which is a real + if you run multiple antennas, and LDG's support is super. Download the manual from their site and give it a read.
Filters - can't comment as I'm not running any, but wish I had a 500 HZ for PSK!
Computer Control - HRD - ditto what has been already said.
One other suggestion - check out microHam USB II for a computer/rig interface. Sure, you can build your own, but this little interface is great. Opto isolation on the CAT and transformer isolation on the audio lines. Plus you can download the template to configure it for HRD (as well as a ton of other control program and loggers) Comes with a cable specifically for the 897. And their support is as great as LDG's. Just MHOs and YMMV. But they work for me!

Date: 2007-04-02 13:59:25 UTC
From: ki4hlw
Topic: 18152 Message: 18207

Thanks for pointing this out, I was looking to build one of these and had been looking like mad for plans, all this time they where right under my nose.

But looking at the plans and after a search on the forum I have some questions.

The Variable Resister symbol used is that for a rheostat (aka one with 2 contacts used) but there are 3 wires going into it as would be in a potentiometer, Also a previous post made reference to a pot. So my first question is:

1. Is it a pot with a 10k resister off terminals 1 and 3 and the phono tip off of the wiper? (what I assume was meant.)

2. Or is it as drawn, a rheostat with phono tip on the wiper and (I guess) a set of 10k resisters off the one end?

Second question, is the ground symbol shown on the plans actually a separate earth ground, or just a reference that it is the ground pin on the phono jack? If it is an earth ground as drawn what have those of you who have built it used? In a shack this is easy, but in a situation like mine where I bring the radio into the field a lot, pounding a 8 foot copper pole into the ground everywhere I go isn't an option.

Sorry to ask so much, I'm no expert so I'm trying to do this "By the book", I don't want to damage my brand new radio because I misbuild a $5 attachment. I am probably just reading into it to much.

Thanks for clearing this up for me!

From: subhadeep chatterjee
Topic: 15825 Message: 18208

Dear Friends,
I have a 897D,I purchased last year.The rig is working
great.
But I have noticed that it is not giving full 100
Watts SSB out put on 7M,20M,15M,when I used external
output measuring device.
But it is giving 100 Watts in CW mode in all the
bands.
I have also noticed that it is giving full 100 watts
output SSB in 10 M band?
How can I get full 100 watts output in ssb mode in all
the ham Bands?
Hope to hear you soon.

18209. Re: [FT897] Output is not 100 Watts in SSB-(MAYBE it IS!)

Yahoo group: FT897 (2007)
Date: 2007-04-02 16:47:43 UTC
From: kc3vo@aol.com
Topic: 18209 Message: 18209

Measure the output with the correct meter! To ACCURATELY measure the SSB power, a much more advanced meter is required than to measure CW. What is required, is a PEAK-READING RF power meter, and the good ones will have an internal circuit that requires a battery or power supply to operate. "BIRD" and "COAXIAL DYNAMICS" have some excellent products, but they ARE pricey, about $400-500 US! "MIRAGE" and "DIAMOND" have some more economical units, although accuracy and frequency coverage is generally not as great. For $150-300 U.S., there are some devices with reasonable accuracy. Most of the low-cost (Cheap) meters will only give acceptable results on CW or FM, and SOME are "Optimized " for the 27 mhz "CB" band. Many radios have been damaged or improperly "Adjusted" due to the use of these cheap, inaccurate meters! If your radio shows normal CW and FM power on all bands, the final amp is working!--Beg or borrow a GOOD peak reading meter and a quality 50 ohm, non-reactive dummy load, and you will very likely find that full power is there!---------73, KC3VO, Bob Curry

From: mrmsudawgs
Topic: 15825 Message: 18210

What are you powering the rig with? Batteries? External power supply?

I was using external batteries (like a car battery) for 12V supply but the capacity was pretty low which caused some clipping on SSB when pushing 100W of power. Also, I never could get peak power on SSB but I could on CW. I could back off the power to about 30W and all was well. I've since replaced my battery with higher capacity which resolved my issues. Maybe it is your power supply.

18211. Re: [FT897] Re: Output is not 100 Watts in SSB

Yahoo group: FT897 (2007)
Date: 2007-04-02 17:20:01 UTC
From: Mike Bryce
Topic: 15825 Message: 18211

How are you measuring power?

Most watt meters won't read peak power. and then most peak reading
wattmeters are maybe only 5% accurate at best.

are you using a old MFJ wattmeter? A bird 43? or a array solutions
peak reading wattmeter?

are you doing the old "hola hola hola" into the microphone?

How about a two tone test with the rig into a 50 ohm load. With the
rig being powered by a suitable dc source using the correct power cables

Unless you have lab grade test gear, I would not be too worried about
it.

although not really of great value, but if you can monitor the dc
current and with a very fast amp meter in line, you may be able to
see the peak current on ssb.

Art,

I think Roger is correct! I just bought a TS-2000 for my sat rig,
and I got the radio software that comes with it. However,
after looking at the Ham Radio Deluxe, I think it is BETTER!

Somebody was telling me that there is a mode for the FT-897
that will allow it to operate satellite (uplink on one band,
while downlinking on another) but I was never able to find it.

Don't forget, too, that the 20, 10 or 5 watts that your are "missing" really is not going to matter squat. For every 1db in gain you want to put out, you need at least 50w of power.

1db = 50w

So, If you are putting out 90 watts, you are doing great by my standards!

Unless you are going to get up there with the big boys and start playing with 500 or1k watts of power, do not worry about the small values!

Hi...

I had a similar problem from new but only on 6 and 2 meteres and 70cms.
As it was under warranty, I sent it back to Yaesu. They fixed it, but
I never heard what the problem was.

There is, it is called "split" operation. You can find it in the ABC menu "SPL". You will need to set VFOa on one freq and VFOb on the other. The split can be same or different bands.

Art,

I think Roger is correct! I just bought a TS-2000 for my sat rig, and I got the radio software that comes with it. However, after looking at the Ham Radio Deluxe, I think it is BETTER!

Somebody was telling me that there is a mode for the FT-897 that will allow it to operate satellite (uplink on one band, while downlinking on another) but I was never able to find it.

73,
John

Ham Radio Deluxe. Superb software when used with the FT-897.

Really? 1dB is approximately 10%, not 50W remember dB are
voltage, current or power ratios.

That is still wrong, the ratio between 50W and 100W is near
as dammit 3dB, as is the ratio between 2.5W and 5W and 10kW and
20kW.

Never did like coffee :-)

Forgot to mention I was using the equation as an example in relation to the small amount of power that he thinks he might be missing, since many people look at the "gain" part when talking about power. Therefore, if he was missing say, 10 watts, his signal would not change much, if any.

In order to change your signal on the receive end, an increase in power of a minimum of 50w would be needed to show any significant increase in signal strength on an s-meter on the receiver.

I just figured he would be able to figure that out, but I appreciate you saying something.

Topic: 18152 Message: 18222

Go to Radio Sh___ and tell them you want a 10K potentiometer..I just dug mine out of the parts box and looked for one that was stamped 10K on the side of it. The schematic line that has the arrow (green) goes to the center lead of the potentiometer. I don't use a separate ground. The difficult part was finding a switch that I wanted to use. It is a dpdt or dpst type switch. I wanted a momentary contact one, but they are apparently hard to find. As such, it is a small toggle. Don't worry about asking questions...I actually had to contact the designer of the circuit to get some clarification. Good luck!

Hal, KI2U

--- In FT897@yahoogroups.com, "ki4hlw" <ki4hlw@...> wrote:

Thanks for pointing this out, I was looking to build one of these and had been looking like mad for plans, all this time they where right under my nose.

But looking at the plans and after a search on the forum I have some questions.

The Variable Resister symbol used is that for a rheostat (aka one with 2 contacts used) but there are 3 wires going into it as would be in a potentiometer, Also a previous post made reference to a pot. So my first question is:

1. Is it a pot with a 10k resister off terminals 1 and 3 and the phono tip off of the wiper? (what I assume was meant.)

2. Or is it as drawn, a rheostat with phono tip on the wiper and (I guess) a set of 10k resisters off the one end?

Second question, is the ground symbol shown on the plans actually a separate earth ground, or just a reference that it is the ground pin on the phono jack? If it is an earth ground as drawn what have those of you who have built it used? In a shack this is easy, but in a situation like mine where I bring the radio into the field a lot, pounding a 8 foot copper pole into the ground everywhere I go isn't an option.

Sorry to ask so much, I'm no expert so I'm trying to do this "By the book", I don't want to damage my brand new radio because I misbuild a $5 attachment. I am probably just reading into it to much.

Thanks for clearing this up for me!

LOL, sorry but I found that funny, if my local RadioShack had someone come in with that printout and ask for a 10K Pot they would tell them to hold on a sec while they called me to ask what and where it is, they just about have me on speed dial. I build things off of schematics all the time, including things for 10,000 Watt radio station transmitters, I just had some questions because the drawing didn't quite match up. As I said I'm probably just reading to much into it.

So I take it the "ground" is just a reference symbol and not a true earth ground, and that one 10K pot comes off 1 and 3 then... I'm going to go with that plan unless someone jumps in and tells me otherwise.

Interesting... My tuner does this all by itself. I have an LDG Z-11 pro. I installed internal batteries so the tuner works without needing any power connections. It has a cable that plugs into the ACC connector and it lowers the power and puts out a CW signal until it's tuned (about 3 seconds for a new frequency and about 1/2 second on a frequency it has done before).

it's not the antenna (or the power)! ;)

Try listening to yourself on a different receiver with headphones on and adjust the carrier point, etc.

What is the ALC doing? What is your callsign?

When I transmit on SSB there is a hollow sound in the background. I've
tried a different mike, adjusting the power and mike gain down to 5
and 4 respectively. I'm using a GVRV5 for the antenna. Any
suggestions?

IMO HF S points should be 3dB whereas above 30MHz 6dB is correct,
this allows the S meter to reach down into the noise floor of the
RX. I have not carried out any measurements on my 897 as yet but
first opinions seem favourable.

IME many folk do not understand what a decibel is and do not
understand that to increase a signal by one S point on HF (given
the above) you will have double the TX power be it from 1W to 2W
or 1kW to 2kW.

Me, I stick to VHF and above and measure signals in dB above the
noise.

If you use the same aerials etc both with and without the amplifier(s), the gain in S meter reading will be proportional to the difference in output power. If you are using the 897 barefoot, then you will get ~100W. If you get 1000W from the amp. then you will get 10dB extra signal, just over 3 S points and probably worth having.

Which band would work the best? If the amp. is flat in frequency response, then one band will be much the same as the other.

Of course, the above is theoretical and depends on many factors including power supply performance, the amplifier itself and the remote receiver S meter peformance.

The symbol is for a 10K potentiometer (3 wires). The wiper is the
arrow. There are two 10K resistors, one on each of the
fixed ends.

This is how resistors are drawn in Europe, not a squiggly line,
but a block. Wait until you see how logic gates are drawn!

> Second question, is the ground symbol shown on the plans actually a
> separate earth ground, or just a reference that it is the ground pin
> on the phono jack?

Just the ground pin on the jack. The idea is that you put
a negative voltage in the ALC input of the ACC pin;
a negative ALC voltage causes the tranceiver to fold down
it's output.

But, I've investigated this approach earlier and I'm not too keen
on this. The negative voltage is on the tip. If the plug
isn't pushed in fully, then the negative voltage goes to
the middle ring (not ground ring) connector of the ACC plug,
which is the PTT pin of the ACC plug.
The PTT line directly goes to the main CPU (with some buffer
resistors, but that's it).
Hence, if the plug isn't in in full, then you will inject a
negative input voltage on the CPU pin. This is a receipe
for destroying CMOS circuits, in this case, the CPU.

I had originally contemplated to put a DC-DC converter in the
LDG AT-897 so when it tunes, I'd reduce the power this way,
but the thought of blowing up the CPU kept me from doing this.

Has anyone investigated whether the internal-battary-reduces-power-to-20W
circuit can be abused to reduce the PA output during a tuneup?

My apologies to DF1QQ.

Geert Jan

If these amps are designed for LEGAL U.S.A. amateur multiband HF usage, they will have at least SIX separate, internal harmonic filters that would need to be switched when changing bands.
An arrangement to properly do this on both amps would be required, as would an arrangement to assure proper phasing and matching, if parallel operation were attempted. If the amps do NOT have these internal bandsitching filters, they are very likely what I refer to as "CB" amplifiers, designed with ILLEGAL 27 mhz operation in mind, and NOT legal or suited for amateur radio use in the U.S.A. or anywhere else that is concerned with radio spectral purity!
Amplifiers such as these will transmit on more than ONE band at the SAME time, courtesy of their high harmonic output. DO NOT use cheap, unfiltered amplifiers on amateur radio!---73, KC3VO, Bob Curry

They are our course though Bob a cheap place to start from if you are going to add some filters.

Somewhere I have a solid state 27MHz 100W Italian amp that I was starting to mod for 6m. Surprisingly it was quite clean if not over driven / biased.

Bit of simple filtering and would have been OK, when I get round to it!

If single-band operation is desired, modification is not as difficult, but to filter for 160-6 meters, normally at least 14 inductors, 21 capacitors, and 14 relays are required to make and switch the seven separate, 5 pole, low-pass filters that would be required.-Many of these cheap amps ALSO radiate VHF/UHF frequencies from the power leads/circuit board, and better shielding/bypassing/decoupling may be required there also.-KC3VO, Bob Curry

18233. Re: High SWR Protection Question - Tuning box

Yahoo group: FT897 (2007)
Date: 2007-04-03 14:54:10 UTC
From: ki4hlw
Topic: 18152 Message: 18233

My fault, I wasn't clear about what I thought was drawn wrong on the diagram. I wasn't referring to the squiggly line verses the block, I'm also use the block method. I was referring to the location of the arrow (through the resister at a slant vs. pointing at one side) hard to explain so I found a website that has a picture, look at the resister section.

http://www.kpsec.freeuk.com/symbol.htm

Again I'm not trying to downplay DF1QQ's great work in designing this and releasing it to all of us freely, as I said I just didn't want to build it wrong and blow up my new rig. I built the box last night as I felt it was meant to be and it works great, only issue is my 9v Battery is actually putting out 9.5v so the pot only works in the top 25% of it's movement... below that is all minimum power. As the battery wears out I expect this will change.

As for using the battery circuit I originally had been thinking along the same lines, what I realized was the FT-857 has a 5th wire in the power plug that is used to tell the rig when it is on batteries and downgrade it to 20 watts. I don't have an 857 to look at, but if you could figure out where this wire goes on the board, and considering the 857 and 897 are really the same rig, you should be able to attach one to the 897 that does the same thing.

Thanks again to DF1QQ!

To make a 'pot' into a rheostat all you have to do is connect the wiper terminal to one end of the pot. You can just leave one end floating (unconnected) but it is better to connect it to the wiper.

"Measure the output with the correct meter! To ACCURATELY measure the SSB power, a much more advanced meter is required than to measure CW. What is required, is a PEAK-READING RF power meter, "

I agree with Bob. You need to measure SSB with a PEP meter. I use a Daiwa CN-801HP.

Then again, don't sweat over being maybe 10 to 15 watts short of a 100. On the receiving end that equals about a fraction of an S unit. In a perfect world, 1 S unit = 6 DB of signal or the difference of 25 watts out vs 100 watts out. So 80 watts compared to 100 watts on the receiving end might be the thickness of the other guys' S meter needle. Most of the time I'll have my power cranked back about that much just to help keep the finals a little cooler.

"...If you are using the 897 barefoot, then you will get ~100W. If you get 1000W from the amp. then you will get 10dB extra signal, just over 3 S points and probably worth having. ..."

Huh.... Disagree with you there Geoff. 10 DB = about a S unit and a half. 1 S unit = 6DB, 2 S units = 12DB (I like to call them Dog Biscuits) and 3 S units = 18DB. Therefore ~100 watts x 3 S units (or 18 DB) would = 6,400 watts. (doubles 6 times)

While DX trolling I would love to flip a switch and get 3 S units and that would definitely be worth having!

Oh I know that a pot can be made into a rheostat, that was really the basis of my original question. It's drawn as a rheostat when I believe it was meant to be drawn as a "pot". I still stand that I believe the diagram is drawn with the wrong symbol.

Thanks for the answer: "There are two 10K resistors, one on each of the fixed ends." this is exactly what I was looking for.

As I said earlier Jerry, although there is no fixed definition of
a S meter, I believe that the ARRL issued a suggestion that < 30
MHz an S point is 3dB, S9=100uV and > 30MHz 6dB, S9=50uV into 50
ohm.

This was 'agreed' back around the 70's between all the major
players, but some more recent measurements:
http://www.seed-solutions.com/gregordy/Amateur%20Radio/Experimentation/SMeterBlues.htm#
has shown that manufacturers do not design for 'calibrated S-meters'

As I said earlier, as a VHF and up operator I think that dB above
(or below) the noise floor is more meaningful.

Geoff

Well Cowboy, I guess we agree to disagree.

Arthur Collins of Collins-Rockwell Radio Company did establish an industry standard for S meters, since prior to that S meters were just simply relative signal strength measuring devices. Most manufacture's do attempt to design their receivers after Collins' standard, however, we don't live in a perfect world. Now do we?

Good o' Arthur's standard is simple, and I'm sure you've heard it before but I'll say it again; 50 micro-volts at the Radio's antenna connector = S9 and each S unit deflection on the meter = 3DB difference.

The formula has always been and until water begins running uphill, it will always be: Power difference in DB = 10 LOG (Power A/Power B). And I agree with Arthur that each S unit is 6 of them DBs. Every radio I have ever owned, including my FT-897D, sort of kind of tracks that standard. But none of us are perfect, huh?

Just say you agree with Mr. Collins or say he was nutz. Somebody had to standardize this stuff and I like his way of doing things. He made darn good radios.

And if you disagree with this, don't get your panties all in a knot. Just say you agree that we disagree. Okie Dokie Smokie? Still Pals?

Gee Whiz!

While it's generally considered impolite to reply to one's own
message, I hope you will forgive me:

I've looked at the diagram, and connecting a diode (1N4148)
and 1K resistor, in series, between:
- cathode: joint of R1567 and C1573
(on the PCB this is near jumper J1027, you want the
small resistor/capacitor close to pin 2 of the jumper)
(see picture ft897-txprot-cathode.jpg in the files section)
- anode: Pin 2 of J1001, which is the flexfoil that goes
to the PA board.
This connection is reachable via pad TP1003
(see picture ft897-txprot-anode.jpg in the files section)

When TX is made active via the ACC plug (as is done with
the LDG AT-897), R1567 is pulled to ground.
Via the diode, this pulls down the DC/BATT signal, which
makes the processor think it is running on battaries and
will reduce output power to 20W max, hence saving
the PA transistors.
You can tell whether it works because the small battary symbol
will show on the display when the ACC TX pin is pulled down.

This avoids the nastyness of potentially introducing negative
voltages at places where they can do damage.
Also, no external components.

You'll need good tools to make this change as the components
are rather small (see how big the normal components look
in comparison).

Do temporary disconnect the flexfoil to the PA board
when installing this. The flexfoil can just be pulled out
gently, you don't need to pull up the connector latch
(you'll break off the connector, the damage on the photo is mine).

I hope this all makes sense.

73,

Geert Jan PE1HZG

When in the SSB mode and you speak into the mic you won't see your power meter read 100W. Even most peak power meters still won't show 100W on the peaks. That's because the sounds you make with your voice when speaking aren't enough to drive your rig to full power. You can try saying the usual "hellooooooooooo" or "ohhhhhhhhhhhhh" which might get you close. What I find works it to whistle into the mic. Try to get a nice single tone note without too much air sound. I find it works even better if I whistle while inhaling instead of exhaling. Makes a cleaner tone. Even better is to play into the mic the sound from a pure sinewave signal generator, or a musical instrument tuner which puts out a pure note (usually an A4 at 440 Hz.). When I speak into the mic and read the power in the "peak" mode on my Diamond or Palstar power meter it does not show anywhere near 100W. If I then whistle into the mic it will then show darned near close to 100W.

If you try it with a BIRD meter, model 43P (Peak) which is powered by 2 internal 9 volt batteries, and select PEAK mode you WILL see 100 watts or VERY CLOSE on normal voice peaks! --Perhaps there is a problem with the "Peak detect and hold" circuit in your meters? (I find that the COAXIAL DYNAMICS peak meter will ALSO read 100 watts on SSB/AM/FM or CW, from a good 100 watt radio, when the PEAK circuitry of the meter is used. Borrow one, and see the difference!---73, KC3VO-Bob Curry

No, I am not disagreeing with you Jerry - nor anybody else - but I
would raise two points:

1 given what you say, S0 = 0.1uV which is a reasonable noise
floor for a SSB bandwidth UHF RX but how many HF RX's can
achieve this - HF receivers !should! be designed for
dynamic range rather than low noise.

2 there is a wide rnge of variation of S meter responses -
see the table.

18248. RE: [FT897] A different way to protect SWR during tuning

Yahoo group: FT897 (2007)
Date: 2007-04-04 02:40:24 UTC
From: Dennis
Topic: 18242 Message: 18248

Without going into a large ang boring explanation;

Yes, it is well known that running the 897 off the internal batteries limits the radio to 20W MAX across the board (ie, on all bands).

Don't know the circuitry involved...I'' let you figure that out.

Dennis - N8BMB

> Don't know the circuitry involved...I'' let you figure that out.

Respectfully, I think you miss the point.

The DF1QQ box, as well as the LDG AT-897, trigger the transmitter
of the FT897 using the PTT contact on the ACC plug on the back
of the 897. If you pull down this signal, the FT897 will transmit
a carrier (even if set in SSB mode), and with full 100W power,
if connected to 13.8V power supply.

The LDG AT-897 uses this, if you press the TUNE button on front,
it connects the PTT through the ACC plug in the back, so it has
an RF signal to let the tuner do it's thing.

Generating a 100W carrier to tune, puts strain on the finals,
because the SWR is bad (that's why we're tuning, right?).
I'm also not too keen on switching relays inside the tuner
with potential high voltages due to the misadjustment.
Reducing RF power during tuning reduces this problem.

The DF1QQ box uses the ALC input of the transceiver to reduce output,
so the finals have more breathing room under poor SWR conditions.
But, the DF1QQ box injects voltages that may cause problems if
the ACC jack isn't inserted in full, and it requires an external
battary, a potentiometer and some other goo to make it work.
So, you'll have extra clutter in your kit.

My mod tricks the FT897 into thinking it is running on battaries
when PTT is given through the ACC plug. The FT897 notices and
reduces output power to 20W max.
When tuning is complete, the power will be restored to the usual 100W max.
So, when pressing the TUNE button on the AT897, it will tune
with the reduced 20W power, but when you transmit using the microphone,
the rig will put out it's full 100W output again.
No extra hardware, no clutter.

And I thought this was worth reporting about.

>

Yes, you are correct, the symbol is wrong. It should show the wiper connection going in at 90 degrees and the arrow head just touching the outline of the "resistor".

The resistors at each end of the pot are there to limit the range that the o/p voltage is adjustable over. The ALC i/p that this circuit feeds takes very little current, and this circuit works fine.

John's right. It looks like a Molex, but it's actually a Japanese connector. In addition to Quicksilver, Tower Electronics and other commericial vendors carry them via the internet or at major Hamfests. (I saw them sold at Timonium this past weekend.)

Most Amateur Radio folks simply refer to them as the "Six pin Yaesu/Kenwood HF Power Connector". My Kenwood TS-430S and TS-2000 use the same one. BTW, only four of the pins are normally used for powering Amateur Radios.

Correct. But their is no "standard" mini-DIN connector; they come in
many flavors of pin orientations.

The Data cable (not the CAT cable) is also available from Kenwood as
they use the same mini DIN connector for their data cables for their
higher end dual band VHF/UHF rigs. I had one for a previous project
involving my TM-V7A that I no longer needed and reused for the FT-897
data (not CAT) cable to to connect to a sound cards input and output.

Hi. I absolutely refuse to pay the silly money wanted for a MH-36E8J dtmf microphone for my 897 but my ft-1500 has a MH-48A6J and I'm wondering if an adpater has been made or designed so i can use my MH-48A6J as a dtmf adapter for my ft-897? Is it something I can make myself like a simple sireover or do I need to put a load inline?

Thanks.

Note with the the FT-897 and AT-897, pushing the "tune" button on the AT-897 will place the radio in transmit mode at the power level set via menu #75 .. I usually
turn the power down to 5 to 10 watts via menu 75 before hitting the "tune" button, then set the power to what I plan to actually use **after** the antenna system is tuned via the tuner ..

Hello,

You are all very close, but just missing it a little. The radio will "never" transmit 100 watts if the SWR is above 2:1 (unless the radio is already broke). There is a linear progression of lowering the RF power as the SWR increases. This is called a "foldback" system.

In the FT-897, there is a very agressive foldback system that will go as far as shutting the transmitter off for up to 250 milliseconds if the SWR is above 2.0 and abruptly changes to be higher.

The bottom line is if the SWR is bad enough so that you need to press the tune button, the radio has already lowered the RF power to a safe level. There is no benifit of lowering the RF power before tuning.

However, there is also absolutley nothing wrong with lowering your RF power before every tune.

I'm pretty sure that's negative, Johnny. Using the cable, the AT897 will put the rig in CW mode to tune, but it will stay at what ever power level you were previously on. I always manually back the power down to 10W before tuning.

18261. FT-897D and Ham Radio Deluxe

Yahoo group: FT897 (2007)
Date: 2007-04-05 14:08:39 UTC
From: Rich
Topic: 18261 Message: 18261

This is more of an annoyance than a problem. I just installed the W4RT SSB and 500hz CW filters in my 897D. They function quite well. The problem is with the logging module of Ham Radio Deluxe. Operating CW with the new filter causes the 'Mode' to be set to TOR rather than CW. If I select the SSB filter or the stock ceramic filter it switches to CW. Like I said, it's an annoyance. Does anyone have any idea why this is happening or how to resolve it? Any suggestions will be appreciated.

18268. A little help, please

Yahoo group: FT897 (2007)
Date: 2007-04-06 22:35:35 UTC
From: Ross
Topic: 18268 Message: 18268

Well, it's been a while since I've posted and I'm still mulling over which way to buy a new 897D. I can't decide if I should get the batteries or the internal power supply. The guy at HRO suggested I get the batteries and an external power supply. I'm thinking of getting the internal power supply and making a cable to attach to a battery in case of a power outage. I will probably always have a car or truck nearby and I could put some alligator clips on the end of the cable and use the car or truck battery. Seems to me that is a more portable setup than internal batteries and an external power supply. I would sure appreciate it if someone with experience constructing their 897D for portability and for a base station at home would give me some pointers on this. Also, in the event I wish to go mobile with it what is a good antenna?

Thank you for any help you can be.

Ross

HELLO ROSS
i have an 897d with 2 internal batteries- i also just acquired the internal supply- i decided to construct an extension cable and put the internal supply behind the operating dask on a bracket. i made a 4 foot lond power exrtension cable consisting of a male connector on one end, the chasis female connector on the other end, with a second male pigtail connector near the rig end. this enables me to use the internal supply externally while being able to attach the cd 24 charger to the pigtail (to charger the batteries whenever necessary) since i have an external outside antenna have not experienced any rf coming back down the extension cable.- i would expect some rf to come back down the extension cable if using a localized antenna such as the miracle whip or outbacker type antenna.

If your planning using the radio mobile and not portable you might want to consider the 857 which as the removable face plate. For the discussion of the ft-897 mobile is when your using power from a car, portable is when you don't have any power source. If your not going to use the internal batteries is the why get the ft-897?

I rarely use the internal batteries and I think I would have been happier with the 857, but at the time the 897 was perfect. Honestly the question for me now is should I purchase another ft-857 or an ic-7000, but back to you question.

If your going to connect into multiple locations I can't stress the Anderson power poles enough. They are easy to crimp and real easy to use, you can even plug your radio into the cigarette lighter if you control your power out.

For mobile I recommend a screwdriver type antenna, I am using a dk-3 but there is a lot of other types. If you purchase a good mobile antenna you won't need a tuner for the radio.

With my first FT-897 at HRO, they suggested the batteries and the charger, which I bought. I later sold the radio/accessories, and then had seller's remorse, so I bought a second one, and then recently added the power supply.

With the internal battery solution:
1. You have to keep them charged, and all batteries have a finite life.
2. The batteries won't adequately power the ATAS-120, which is the antenna I like and use (to answer your 2nd question).
3. Power output is limited to 20w.

With the internal power supply:
1. It can be a backup in case the external supply fails.
2. Most places I will go with the radio (even EmComm support) will have AC power.
3. If you make an adapter cable like I did (eg, Anderson PowerPoles), it can power other accessories (like a tuner).

I do have external batteries; 18aH for $32. Granted, not quite as portable for EmComm, but I think it's more flexible.

By the way, the FT-897D comes with a separate power cable to run to an external power source.

Do check out Anderson PowerPoles and the West Mountain RigRunners; that may help decide how you configure your stations's power distribution.

Topic: 18268 Message: 18273

Gosh, James,
Why don't you muddy the water a little bit? Aren't I confused enough? Just kidding! You make some good points and you got me to thinking. I will not actually use my 897D as a mobile radio, per se. However, I was just thinking about emergencies such as power outages and the rolling blackouts we seem to get in the summer. These seem to go along with a bad fire season. I may want to go to another location to use my radio in our emergency network we have county-wide. In that case I was wondering what would be the best way to have my radio set up. I could have the internal batteries, but that means an external power supply, as HRO suggested, which means more to carry. I'm just thinking outloud. I have no experience in any of this. In fact, I don't even have HF right now, although I am a General. I have a Yaesu 8900R in the truck, but I now wish I had put an 857D in there, and I may do that some day. In the meantime the 897D has to be as portable as possible. I was thinking I could use the truck battery in an emergency, but don't know what I would do about an antenna.

Thanks for your help. I'm all eyes and ears for more.

18274. Re: {Disarmed} [FT897] A little help, please

Yahoo group: FT897 (2007)
Date: 2007-04-06 23:30:50 UTC
From: Dennis Willson
Topic: 18268 Message: 18274

I bought the 897 with internal batteries and bought an MFJ external power supply. I take my 897 portable a lot... I like to be able to just plop it down on the table, hookup an antenna (for 2m and 70cm I just hook up an HT antenna on the back of the radio, for 20 and 15 meters I use an antenna designed for the 817 or a super antenna. The MFJ power supply is very light. I made up a set of cables that allow me to run the radio from either its internal batteries, the MFJ power supply, a cigarette lighter outlet and I made up a set of battery clamps (all interconnects are via power-poles). This setup gives me the broadest possible amount of configurations.

I use an LDG z-11 pro antenna tuner with internal batteres. That way the antenna tuner is not dependant on power from the radio. Using lithium batteries the whole antenna tuner with batteries is still very light.

If you want to do base and portable operation I think the 897 is a great radio. If you are going to do mostly mobile operation, the 857 would be better, however, it does not have the ability to use internal batteries so portable operation is a little more limited.

Really? 1dB is approximately 10%, not 50W remember dB are
voltage, current or power ratios.

18278. Frequency Calibration FT-897D

Yahoo group: FT897 (2007)
Date: 2007-04-03 20:06:09 UTC
From: ve6xl
Topic: 18278 Message: 18278

I have a question regarding the TX/RX frequency alignment of the FT-897D.

Does the following still apply even for the "D" model?

- Connect frequency counter to TP1032
- Adjust TC5001 to 67.875000 MHz

I have been looking for both TC5001 and TP1032 on the PCB and cannot find them. Perhaps the TCXO is involved here?

Thank-you....

Guys, you're making life too difficult.

All you have to do is put the rig in AM mode which automatically limits
the power output, key the mic, tune your tuner, and you're done.

18280. Need info on FC 20 and 180 foot loop

Yahoo group: FT897 (2007)
Date: 2007-04-05 15:30:21 UTC
From: fzavada7
Topic: 18280 Message: 18280

I am new to this group and have joined for info on the FT897D as you all have. I have also just moved to a CC&R type community that prohibits antennas. I am thinking about getting the FC40 tuner and putting a wire around the house under the eves, feeding the loop at a corner of the house for a low impedance feed point. Total length of wire would be about 180 feet. Am looking for operation from 75 meters and up. Does anyone have any info or has anyone tried this.

18281. Bowing Out

Yahoo group: FT897 (2007)
Date: 2007-04-05 18:15:29 UTC
From: Peter Short

Hi,

As most wattmeters are only + or - 5% accuracy,

the most accurate way to measure power is with an oscilloscope and a dummy load.

The oscilloscope should have a frequency response that covers the rf you are measuring.

Connect it to your transceiver output jack using a T connector and be careful of RF burns.

Read the peak to peak voltage and use the power formula

E squared divided by R (50) ohms.

It works on CW and SSB.

18283. Which to buy Ft897 or Ft857

Yahoo group: FT897 (2007)
Date: 2007-04-07 03:05:12 UTC
From: Terry
Topic: 18283 Message: 18283

Hello to all. Ready to purchase my first radio in a few weeks. Thinking of buying an 857 or an 897. Looking for suggestion, which one may be the better starting place? (I've been reading tons of good stuff here in past postings but would appreciate a revisit)

Does one have more physical controls on the faceplate to reduce menu use? Apart from the 897 including DSP, does one unit have more digital options/ modes (bells and whistles) ? ie Programming? Software? CTCSS? ? Rtty & Psk31 abitiy?

Looking to use it primary as a base radio (HF) with some mobile use for club events (vhf). On rare occasions, put it on the boat for news and weather (weather fax via computer software) and short-range communication with other boaters (couple hundred miles). As a base unit I would like become efficient with digital commutation as well as listen and learn how ham and maritime nets operate, and someday be of some help to boaters at sea.

I understand that I am asking for opinions and everyone is entitled to their own. My intent is not to muddy the water between owners of radios just looking for someone to share some real "hands on experience". Thanks in advance for all that is shared. Terry KI4RXC Mail direct is welcomed. terry23462 at cavtel dot net

Did your blown diode result in zero or VERY LOW output? The reason for my question is I have an 897 (non-D) that is showing 2 watts on UHF. All others seem fine. I figured it was the finals but you're experience seems to indicate that I might want to try to look elsewhere...What are your thoughts?

More like 2 S units on a generous meter (5db per S unit). A bit
less if it's calibrated 6db per.

On a quiet band with signals well above the noise, the linear is
probably superfluous. On a noisy band (e.g. 80m with a lot of
QRN), it may be essential for some communications.

Hello Ross,

I have used my FT-897D in the field and would recommend the internal power supply and not the battery packs.

I use AC power to power the Rig most times, however I attached Anderson Power pole connectors and purchsed a 33 AH AGM battery. This is the same type of battery used to power small electical carts. This battery can power the rig for 5 hours + SSB at full power.

I have information on my website if you need further info:

Terry
Can't say a lot about the 857 but if it does as well as the 897D, it would be a good rig. I regular use at the house, I only use the menus when I need to change power or cw speed. (I now use the internal keyer) I leave the main menu on DNR/DNF/DBF, as these are the ones I use most. Everything else I can and do control from the buttons and dials. I like the display on the 897D and the controls are easy for me to manipulate. I have found very little to fault this radio and would be quite willing to take it mobile if needed. It is not as small as the 857 but you could not put that much hardware on the front of a smaller rig. I am now waiting for a LDG Z11 pro to come in next Tuesday to replace my 969 mfj tuner and will shortly be putting up a hundered 30 ft. 40/80/160 meter trap dipole to get back on the top band.
I can only give you my opinion and we all know that 10 people can have at least twice that many. At any rate, good luck and hope you have a blast with whichever you decide.

When you listened to the output on another receiver, were you using
headphones? If you were, were they over-the-ear types or on-the-ear
types? It sounds like you may have been getting just a little bit of
feedback. Do the same test with someone at least a few miles away on
another rig. That will be the real test.

Suggest you use covered wire, rg58 or rg8x coax as antenna wire fed by 450 ohm ladder line with a 4 to 1 or 9 to 1 balum where you are going inside. You may want to cut your antenna wire at the opposite corner and will then have a zep antenna. It will at least work 80 meters on up and with the proper tuner, you may get into 160 meters as well. I would go with a tuner with more range that the Yaesu brand. Several people here swear by the LDG auto tuners and I have one on order. Just remember it is no problem to paint coated wire if it is not the right color already. It's hard to keep a good ham off the air.

It's a nice method, and one I use myself from time to time, or my RF voltmeter, or the spectrum analyser.

But don't forget many hams have CRO's that were thrown out by the commercial boys 20+ years ago.

The accuracy is now just as suspect as their watt meter, really 5% is probably more than they can expect, 10% wouldn't actually make much difference to operation, if it's within that and your kit isn't known accurate they are better to leave it alone. Trying to get half an S point could mean twice the heat in the RF power stage, and oops blown finals, the gain just isn't worth bothering with, spend the time on antennas and coax where there is so much more to gain.

Hi Craig

Yes I believe it is normal. When using the up down control only a small movement to either side is required. If you push it too far in either direction the rig switches off. It is actually an almost useless function on the FT897 as most movements of the up down ring result in power loss. The key is very small movements,until you hear the first beep then stop moving and listen to the second beep radio should now be tuning up or down. Or you can plug the MH-31 into the MD-100 and use the up down buttons on it

That is a normal function of the MD100. It gives you the ability to control the radio for the on and off without having to reach up to the radio. It is a great mic.

From: Michael Yancey
Topic: 18292 Message: 18297

That's odd. Only the 'FAST' button, when held down rather
than clicked, is supposed to turn the rig off.

Perhaps in the MD100, when UP/DOWN is pressed, the
whole mounting area flexes depresses the FAST as well.

I was fortunate enought to find an older MD-1 mic and,
after a bit of soldering together a 'gender changer'
cable to convert from 8-pin round (MD-1) to modular
plug (FT-897), I have all functions of the MD-1 working.
Only the FAST turns the rig off with my setup...

I need to write up the pin conversion and draw a diagram
for the files...

18298. Re: Which to buy Ft897 or Ft857

Yahoo group: FT897 (2007)
Date: 2007-04-07 16:43:09 UTC
From: kd7hcwop
Topic: 18283 Message: 18298

Greetings!

The 857D and 897D are, essentially, the same radio. However, the new 897D comes with the high-stability crystal unit and the 857 does not. This would, mainly, be important if you chose to operate digital modes. Both have DSP which works great.

Although the 857D is packaged for mobile use, it will certainly function perfectly as a base station with an outboard power supply. The 897D controls are, probably, considered easier to use by some operators, but that is personal. I like the way the controls are layed out on my 897D.

I purchased an 897D because I use the radio portable and for emergency use. I think that the 897D is ideal for these tasks because of the ability to have either a built in supply or built in batteries. The rig fits perfectly in a reasonably-sized carry-on for travelling.

My 897D works great with built-in power supply, and it is handier than the IC-706 that I previously used portable. Having to carry an outboard supply was a pain. If an op chose the 857D for mobile and portable use, I think the small Samlex power supply would be a good compromise for travel. I have used that supply and it is identical to one of the Yaesu supplies, but more than half the price! Samlex, I believe, is a Canadian company, but the units are manufactured in Taiwan (no noise and they run cool--I use one at my school club station).

After a couple of weeks with either the 857 or 897, you will become a vertuoso with the menus, but nothing takes the place of a bigger radio with dedicated controls for what are menu functions on these little rigs.

Other considerations would be the headphone jack on the front of the 897D (I prefer it in front). Also, the 857 has a detachable control face and the 897D does not.

So, if you are mainly interested in using the radio mobile, I think the smaller 857D would be the best choice. For something more than a mobile radio, the 897D offers other excellent possibilities.

Go to the ARRL site, if you are a member, and read the reviews. The article does a good job comparing the rigs.

Good luck & 73,
Rob KD7H/KC7LHG

Hi Terry,

I own both radios....the 857D and the 897D...I find them indistiguishable operationally...and consider both of them excellent rigs. I use the 897D as a base station...and the 857D for mobile (with the ATAS-120a) and portable....both second home portable and picnic table portable...even hiking trail portable

I use both for on the satellites and on PSK-31...as well as SSB (gave up CW at puberty)...both have DSP, BTW.....if I had to choose just one radio, I would go with the 857D...mainly because of the smaller footprint....and probably a slight bias because I just seem to have more fun with the portable and mobile operations with the 857D.

I am in the process of assembling a "Shack in a Bag" for my 857D for even easier portable operations...will get the final components in next Friday. Once I play with it some, I will post some photos at my web site.

Back to point, either radio will serve you well...however,if you intend on going mobile, I think that will probably easily swing the decision to the 857D for you.

18300. MEM/VFO/CH knob switch

Yahoo group: FT897 (2007)
Date: 2007-04-07 21:09:32 UTC
From: Dave Oldridge
Topic: 18300 Message: 18300

I just got my radio (second hand) the other day. The switch
that's supposed to activate when you press this knob doesn't seem
to be working, which means that a number of menu items, including
the 1mhz tuning rate are not available. Is there supposed to be
a pin of some sort extending from the center of the shaft on
which this knob turns? What is it made of and how long is it?

(Going to check it with a toothpick as soon as I get one).

Yeah, I'd have to agree, both radios are great and you won't be sorry buying either one of them. I bought the 897 because it was slightly larger and easier to read, but since I've switched to computer control the issue is sort of moot. It's one family, 817 for mobile QRP, 857 for mobile 100w and 897 as a mini base that can go mobile..

I had some power out (less than 1 watt). Usually, you would have no power output if the final TX transistor was blown. You might want to check your idle current to the final transistor. That could help you determine if the transistor was blown.

Did your blown diode result in zero or VERY LOW output? The reason for my question is I have an 897 (non-D) that is showing 2 watts on UHF. All others seem fine. I figured it was the finals but you're experience seems to indicate that I might want to try to look elsewhere...What are your thoughts?

Very nice radio. Played with one of them, but should have VHF and UHF for its relative high price price. Also DSP seems to be not as smooth as in the 897. IMHO seems to be of little use for me. But surely will find its fans.

I had the same experience as you. But recently I found out that the FT897D only switches of when you push the button completely left or right. You see also the 'running man' on the display. But this button has 5 positions: neutral in the middle, half right, full right, half left and full left.
Try to push the knop a little bit to the right or to the left. You hear the beep from the rig. Then it will step upwards or downwards a frequency or memoryposition without switching the rig off.
When you hold the button a longer time in this position it will start to scan. Just like you do with the MH-31

Cheers,
Evert - PE1DON

There is no "FAST" button on an MD-100.
There is a collar at the base that rotates to left and right to tune up and down. Moving further to left or right activates "FAST" mode when in this mode a very slight increase in movement of the collar activates "power off". I did see a mod somewhere that disables the power off but can't remember where.

Hi Robert,
I'm curious about your statement that you just seem to have more fun with portable and mobile operations with the 857D. I don't have either one, yet, so I'd like to ask how that can be since the 897D is set up just for portability? Would you mind explaining that so that it might help me make a decision? Also, what is "Shack in a Bag"? Maybe you could even link me up with an explanation on that one. Portability is very important to me so I don't want to make a mistake in which one I purchase. I realize the 817 is excellent for portability, but I don't know how to set one up, and 5W just doesn't seem to be enough for emergency work.

Thank you for any help you can be.

From: J. Gordon Beattie, Jr., W2TTT
Topic: 18283 Message: 18313

Ross,

I've had both and I prefer the 897 display and integrated functionality.

If I could have only one rig for portable/mobile/base operations, I would pick the 897.

I am selling mine because I don't have that constraint and need to consolidate the different user interfaces into a smaller set of choices.

FYR: I have an IC-756PROIII, two IC-746PROs and an IC-7000, so the similarities minimize my confusion.

If you are interested in my FT-897, AT-897, two internal batteries, charger and AC charger adapter, microphones and miscellaneous goodies, please email me.

73,

Gordon Beattie, W2TTT

18315. wierd fault on 6 metres

Yahoo group: FT897 (2007)
Date: 2007-04-08 19:05:06 UTC
From: darrenls21
Topic: 18315 Message: 18315

Hi all. I'm getting a fault on 6 metres and am wondering if anyone else has experienced it. I talk ok with no problems at first but then for some reason no one can hear me. I checked the output wih a power meter and the power appears to be going out but i'm curious about the modulation. The mod meter reads ok but that only reads one side of it. one thing i do notice is that when i key over the fan slows down as if i'm drawing too much current but i only use 10 watts and am running a 25 amp psu. Does anyone know what causes this problem? It only seems to appear on 6 metres..

Thanks.

Topic: 18316 Message: 18316

Perhaps RF is affecting your power supply. Is your antenna at least 50 feet
away, and fed directly, with good coax, and properly installed connectors?
Try separating power leads further away from coax/antenna leads. You should
also MEASURE the voltage from your supply, at the radio power connector, DURING
transmit, to see if it stays between 13-15 volts, D.C.---73, KC3VO Bob Curry

Question; How is the 857D & 897D on 6,2 and 440 SSB operation. I want to replace my Icom 551 with a new radio that covers 6 meters but with 100 watts. I would also install antennas for 2 and 440 SSB if I purchased one. My other option would be a 706 MKIIG. I would only use the HF bands if I need a backup to main HF receiver, thanks, GIL

I was considering that option on using it as a zep. I also agree
with you that it seems that the LDG tuners are some what better than
what Yaesu is offering. I would like to get some first hand info on
the FC 40 tuner though as it is similar to SGC type tuners where the
matching is done at the antenna, thus if I mount the tuner (FC40)at a
high point I am getting the

RF current as high as I can and seening as though the house is a single story house and most likely will turn any antenna into a NVIS type antenna at least I can try. Thak you for the reply and you suggetion. Frank KD7HVL

Gil,

I would think that the 857 and 897 would be significant improvements over the 551 on 6M.

Further, I prefer the 897 to the 706MkIIG.

What is your primary rig?

You might want the same manufacturer as things tend to be similar and reduce brain-fade moments.

Thanks & 73,

18323. Re: Which to buy Ft897 or Ft857

Yahoo group: FT897 (2007)
Date: 2007-04-09 02:37:09 UTC
From: robert goodman
Topic: 18283 Message: 18323

Hi Ross,

Bear in mind that I don't have the built in battery packs for my 897D...I got both rigs about the same time and being a minimilist at heart, wanted as little clutter and footprint as possible. If I got the dual battery packs, the 897 would be good for grab and go...except for unplugging all those cables. Ever notice how unportable your notebook computer becomes when it is plugged up with all those cables? For me, it would be the same thing with my 897D...plus IMHO, it would be too big for mobile (even the 857D seems big after the 817ND for mobile.)

The "Shack in a Bag" is a term I coined and trademarked for taking the 857, a motocycle battery, ATU and packaging them in a camera bag...so it is really grab and go...with a dangle for easy recharge...with the goal of making it as close as possible to having the portability I had with the 817...except with 8 aH...check my web site for photos of the Shack in a Bag in the next couple of weeks...

I've had two 817NDs and love that little rig (my wife is convinced I will buy another one)....it is great...but I consider the 857D its successor and a MUCH better rig. I also find the limitation of 5 watts to be a problem and my experience is that going to 10 or 20 watts makes a much bigger db difference than the math would dictate...

18324. Re: Which to buy Ft897 or Ft857

Yahoo group: FT897 (2007)
Date: 2007-04-09 02:46:16 UTC
From: robert goodman
Topic: 18283 Message: 18324

Hi Gil,

They do very well...I use them for satellite work on SSB on 2 and 435...and works great on 6 SSB DX even with my puny dipole.

One of the many great things about both rigs is zero to light...well, 160 to 70 cm....in one rig....SSB, digital, FM.

The antenna is a mobile 6 metre whip. it's in a magmount connected directly to the 897, not via atu or swr metre. The Magmount is on a biscuit tin on my balcony. I live in a tower block so i don't have a lot of options. however i moved it as far away from the radio as I could (about 2-3 metres) and the fault remained.
> Try separating power leads further away from coax/antenna leads. You should

Thewy are nowhere near each other.

> also MEASURE the voltage from your supply, at the radio power connector, DURING

It drops from 13.8v to 13.63

Strange it only happens on 6 metres, none of the other bands. wierd huh?

AHA... So, the FAST button is replaced by a 'positional'
'Far Left' or 'Far Right' on the tune switch...

Sorry; I didn't know that. That's much tidier (fewer switches
to clutter up), but a little tricky. Is the mic audio good
from the MD-100? I've gotten good reports from the MD-1 mated
with the FT-897.

Thank you for all the replies. I was being too heavy handed with my first attempts. Next question. The MD 100 mic has an empty modular plug when connected to the 897. Is it possible to use this plug to connect a CAT interface? I realise that one would still have to change the menu settings to swap over....correct? Craig

I have had, and have seen others mention, problems
with the FT-897D getting RF into it when I transmit on
6m. My antenna is a dipole on my porch and it's about
8' from the radio, which is as far as I can get it
without moving rearanging my office.

HELLO !! I had a minor problem with 50 mhz - the volt
meter on the display would go down to 9v or less .....
I eliminated this problem by installing a decent
common - mode choke on the power cord , right near the
'897 connector - problem solved - 73, Ron KA0RYT

Unfortunately a biscuit tin is not an adequate counterpoise for a 6
Meter whip. You therefore probably have as much RF current coming back on
the outside of your transmission line as you have on the antenna.
Two things you can do. One is to lay out some kind of counterpoise
that's resonant on 6 Meters (1/4 wave). If you do that you still need to
"decouple" the transmission line at the antenna by either coiling the
transmission line there or adding some type of ferrite choke on the cable.
The other thing you can do is to measure back down the transmission line
an appropriate length for 1/4 wavelength on 6 Meter and put a coil or
ferrites at that point so that section of the transmission line becomes
the counterpoise. Of course you'll want as much of that as possible
outside.

18334. Digital modes duty cycle and the ft-897

Yahoo group: FT897 (2007)
Date: 2007-04-10 15:21:44 UTC
From: James Wilson
Topic: 18334 Message: 18334

For field day I will be responsible for digital communications. I have searched high and low, looked in both manuals for the FT-897D and have been unable to find any information on duty cycle.

Does anyone have any information that would help me determine the duty cycle of this type of radio with digital communications?

Date: 2007-04-10 15:49:40 UTC
From: Charles Scott
Topic: 18334 Message: 18335

James:
It appears that the 100W spec for this radio is for 100% duty-cycle. I know from my own tests that the radio will run 20W continuous on its internal batteries indefinitely with considerable ventilation obstruction since I tested it at 20W key-down for more than 1/2 hour while it was fully enclosed in rucksack. I've also had mine open and the thing has a pair of good sized fans with the air directed right across the amplifier board and between it and the frame, which is the heat-sink. I wouldn't be surprised if it could run 100W key down indefinitely with good ventilation.
The other question is whether you'll actually be running full power or duty-cycle for digital anyway. In many digital modes, other than 1200/9600 baud FM packet, you don't want to run it at max anyway to maintain a clean signal. Also in most digital modes other than something like RTTY you're not transmitting continuously either (note that for PSK-31 and such you should be very conservative on power output to maintain spectral purity). I've happened to have run mine recently with PACTOR-III in a local test into dummy loads with large file transfers that took some 15-20 minutes. The radio was running near 60W output for those tests and it didn't get objectionably warm.
Which data modes and frequencies were you considering?

Charles first I want to say thank you. Is pactor-III a 100 percent duty cycle mode?

There are three or four modes that I will be using for field day. PSK31, RTTY, JT65A, and maybe Olivia.

For PSK31 I wanted to run 50 watts this seems like a very good power but I was concerned with duty cycle. Several months ago I bumped my radio up to 85 watts to make a contact in Japan. I was nervous about having a long QSO because of the high power limits. Sadly I cut a great QSO short because I didn't know or understand the duty cycle of the radio. 25 watts on PSK31 seems to be a little low, considering the propagation issues today.

RTTY, I have only used this mode a few times, I was planning on running 50 watts here also.

For JT65A, this is a very short intense QSO mode. I was going to run the full 100 watts, with a 15 second CQ every 2 minutes.

The fact that you had 60W output for 15-20 minutes, leads me to believe that I won't have an issue with the power levels I am considering running.

I don't know what the duty cycle is supposed to be. I had my 897D on full output in the 100 watt fm mode on a dummy load, for a test sett up on 14Mhz, running from an external AC power supply. I got called away and forgot to switch the rig of. I came back after more then two hours and the rig was still delivering full output. However the paint on the dummy load was blistered from the dissipated power. The 987D was quite warm but not hot at all. The dummy load could not be touched with the bare hands it was simply to hot, also the dummy load had to be replaced as the resistance went up to 90 ohm instead of 50 ohms. So I honestly believe you will have no problems at all to use full power in digital mode. 73's Jurgen VK6AHI

James Wilson <james@...> wrote: Charles first I want to say thank you. Is pactor-III a 100 percent duty cycle mode?

There are three or four modes that I will be using for field day. PSK31, RTTY, JT65A, and maybe Olivia.

For PSK31 I wanted to run 50 watts this seems like a very good power but I was concerned with duty cycle. Several months ago I bumped my radio up to 85 watts to make a contact in Japan. I was nervous about having a long QSO because of the high power limits. Sadly I cut a great QSO short because I didn't know or understand the duty cycle of the radio. 25 watts on PSK31 seems to be a little low, considering the propagation issues today.

RTTY, I have only used this mode a few times, I was planning on running 50 watts here also.

For JT65A, this is a very short intense QSO mode. I was going to run the full 100 watts, with a 15 second CQ every 2 minutes.

The fact that you had 60W output for 15-20 minutes, leads me to believe that I won't have an issue with the power levels I am considering running.

Subject: Re: [FT897] Digital modes duty cycle and the ft-897

James:
It appears that the 100W spec for this radio is for 100% duty-cycle. I know from my own tests that the radio will run 20W continuous on its internal batteries indefinitely with considerable ventilation obstruction since I tested it at 20W key-down for more than 1/2 hour while it was fully enclosed in rucksack. I've also had mine open and the thing has a pair of good sized fans with the air directed right across the amplifier board and between it and the frame, which is the heat-sink. I wouldn't be surprised if it could run 100W key down indefinitely with good ventilation.
The other question is whether you'll actually be running full power or

duty-cycle for digital anyway. In many digital modes, other than 1200/9600 baud FM packet, you don't want to run it at max anyway to maintain a clean signal. Also in most digital modes other than something like RTTY you're not transmitting continuously either (note that for PSK-31 and such you should be very conservative on power output to maintain spectral purity). I've happened to have run mine recently with PACTOR-III in a local test into dummy loads with large file transfers that took some 15-20 minutes. The radio was running near 60W output for those tests and it didn't get objectionably warm.
Which data modes and frequencies were you considering?

Chuck

On the topic of the extra modular plug on the MD 100:
Supposedly; a hand mic can be plugged into the modular plug receptacle of the MD 100 and used to control the radio's up - down, direct freq. input, and DTMF tones. Can anyone say with authority if this is the case with the combination of: FT-897D, MH-59, and MD 100?
Thanks, Ken

No. Duty cycle on a connection without much traffic is approximatly 50%. The duty-cycle will shift somewhat from one side to the other when passing any significant traffic. When listening to a PACTOR-III connection you'll hear the two stations going back and forth between each other about once per second.

PSK31 requires much less signal level than you may think. You also have to be careful not to drive your transmitter too hard or you'll degrade the quality of the signal and start to bother other nearby PSK-31 signals. If you're seeing any ALC indication when you transmit you should back off.

> RTTY, I have only used this mode a few times, I was planning on running
> 50 watts here also.

50W continuous should be very safe for the 897. Frankly, with the other modes available, I don't understand why RTTY hasn't been outright banned. (I'll no doubt get flamed for that comment by some old RTTY die-hard.)

> For JT65A, this is a very short intense QSO mode. I was going to run
> the full 100 watts, with a 15 second CQ every 2 minutes.

For EME or Meteor scatter? EME might be out of reach with that power level. Haven't run this mode so can't say about how power affects the signal. In any case, 15 seconds is a no-brainer for the 897D, even a few minutes key-down isn't going to bother it much.

> The fact that you had 60W output for 15-20 minutes, leads me to believe

Don't think so. Go for it!

ABSOLUTELY NOT TRUE !!!

One of the big advantages of the FT-897D is that the SWR meter WORKS
JUST FINE on 2m & 70cm.

Hi Dan. You will need a way to interface your PC sound card with the 897. I use a Rascal by BuxComm. I bought mine as a kit. This interfaces to the DATA jack (6 pin mini-din) on the back of the radio. I have used mine for lots of sound card modes, including PSK31 and 63, Feld Hell, MFSK 16, SSTV, Olivia, among others. It's a real blast!

One thing you will want to watch is to not over-drive the transmit audio on digital modes. There is a separate menu adjustment for the digi audio input so you won't be messing with your mic drive.

Good luck, and let me know if you have any questions.

18347. LDG 897 Tuner with FT 897D

Yahoo group: FT897 (2007)
Date: 2007-04-09 06:55:55 UTC
From: gastbury
Topic: 18347 Message: 18347

I am having problems with my LDG 897 Tuner. Warranty runs out in August. I have sent it back to LDG via RadioWorld where I purchased it. It was doing funny things, tuning off frequency etc. Now it has been sent back to me saying it is working, however it seems to be doing the same thing. RadioWorld did find the same problem as I did, when I sent it in for repair. I don't yet know if they tested it before returning it to me.

I'm wondering if anyone has had problems with the LDG 897, and if so, how did you fair? I read one review on Eham.net and it was scathing of LDGs after sales service. I didn't have to deal with LDG yet, as Radio World should have when they sent my tuner in for repair.

Any Ideas? I live remotely so I don't want to have to keep mailing this tuner back.

Sounds worth a go. I was operating on 6 with no problems for a few weeks. I have a whip dipole i constructed for 80 metres using 80 metre whips. I could easily use 6 metre quarter wave whips instead. That will sort out the counterpois problem. What do you think?

Wow aren't we the PoPo. Everyone was new at one time and you don't have to read them. This is a great forum for any interested Yaesu Ham radio owner. I probably only open 25% of the emails since they do a good job in the subject line. If its of interest to me I open if not I don't. Pretty easy. But to admonish the new folks to the group doesn't speak much of the fraternal order of Amateur Radio Operators. I am a new HAM and was very glad to find this group and probably asked questions that have been asked numerous times but you know what I received answers to them and have even developed friendships and radio contacts from them. And that is what Ham Radio is all about.

Good Luck Sir and 73's
Doug

OK, so his name was "Marius" and not "Elmer"...being an Amateur Radio operator is not like being a motor vehicle operator...it has some particular ethics and rules that should inspire folks to share their experience and joy with others.

I don't think I can negotiate the "terms" very much...Amateur Radio has given me MANY BLESSINGS in my life so I don't grow particularly tired of questions from new folks. I regularly take the opportunity to answer those requests to the list, so as to help the maximum number of folks, including myself, with the benefits of new information and perspective.

A lot of folks don't know about the archived messages or how to access them. Further, new information comes up that supplements the older information in the archived messages.

So my advice is lighten up, remember when you were new or inexperienced, be a good "Elmer" and don't forget to know how to use the delete key if you can't be of assistance.

Have a really nice day!

From: Dean Gibson AE7Q
Topic: 18351 Message: 18359

The problem is compounded by the fact that the Yahoo! search is slow, and is designed to inject as many ads as possible while you browse each page of matching messages. I've done searches before of Yahoo! messages, and they are truly TEDIOUS, even with groups with small message bases.

Which of course explains one of the reasons why I only had a Yahoo! group for a couple months before I got disgusted and went to a phpBB-based message board. Besides no ads, you don't see messages you are not interested in, so there is no need to stop an "off-topic" thread. Portions of threads that go off-topic are easily split away from the main thread into a new thread. When you visit a phpBB board, you see forums, then threads, then messages. With Yahoo! groups, you see messages, and then threads, so it isn't as easy to survey the various threads.

Of course, this requires some level of moderator maintenance of the board and keeping the board software up to date. Yahoo! groups are trivial to set up for those that are not computer-savvy, or don't have the time.

Also, with a Yahoo! group, the messages just arrive in eMail form. With a phpBB-based board, you have to visit the board to read the messages, although you do get notification eMails when someone posts to a thread you are interested in.

18360. Problems with MT63 w/ Yaesu FT-897D

Yahoo group: FT897 (2007)
Date: 2007-04-11 22:54:03 UTC
From: Patricia Gibbons
Topic: 18360 Message: 18360

I recently added soundcard modes to my FT-897D via MIXW and the Tigertronics SignaLinkUSB interface ..

All modes seem to work fine except for MT63 ....

I'd like to know if others on the list have run into problems using MT63, and if they have found solutions that allowed it to work ....

Does MT63 have a really high peak to average transmit power characteristic ??? If so, is a peak-reading wattmeter needed in this case in order to measure RF output power correctly ??

I'm curious if you found the problem with your FT-897D and MT63 ...
I can receive fine if using the IZ8BLY version of MT63 terminal,
however I cannot transmit reliably with either IZ8BLY or MIXW when in
MT63 mode .. all other modes in the MIXW suite seem to work fine ..

Is MT63 especially "fussy" about how it needs to be set up ???

Elaine

Topic: 18351 Message: 18363

I just joined and I am concerned about the incredible amount of email which is generated on the group. My repsonse is in fact probably a little hypocritical in that I am writing a message about my concern about the volume of messages.

I do enjoy the group as I am learing a lot about my favour rig, the 897, however I am concerned about the direction the group has taken as a result of the amount of comment over the leaving of the group by a member. I'm sure many members come and go with out so much fan fare. I would like to see the group get back to the 897, which it was originally started for.

My thoughts are that the message generated by the originated on this subject should have been shared with the moderators or group administrators, which is where it seems the message was targeted, and not on the group posts.

As I have not been a member for very long, I hope that the group will settle back down to techical and other 897 stuff and stick to it. Otherwise, I may drop from the group as the volume of messages may just become to much. No, I don't read every message, but when a large amount of time is fumbling through messages that are not what I joined the grou for, I second guess my decision to join.

I don't want to stiffle any discussion on the above, however, I do want the group to get back to the 897. I hope there aren't any comments and that this is taken as food for thought, and not a debate.

Graham

Elaine,

Welcome to MT-63. It is a great mode for sending text files, bulletins and the like.

It is a little picky about sound card volume settings, coming in and going out.

First, a few questions.

Are you using the microphone input for the signal link, or running it from the data jack on the rear of the 897?

MT-63 is somewhat sensitive to signal overload. Try setting the input volume from the configuration menu so the blue background of the waterfall starts to turn blue-green on incoming signal. Be prepared to change to inverted mode if you feel you have a good signal and aren't getting good copy.

When sending, and if you are interfacing through the mic input, make sure the gain is less than 20. Never use the processor.

These are very general suggestions. I haven't worked MT-63 through my 897, yet. However, I have been working with it using a Rascal and a Kenwood TS-2000 and these are general observations.

When transmitting, consider the following: The processor of the 897 is not the greatest design. The mic gain should never default to 50 as a factory setting. It doesn't start sounding natural until it gets below 20; usually in the 15 to 20 range for mic gain on the SSB mic setup menu. There are digital setup menu options, but if you are using the microphone jack to interface with, you may have to use the mic gain settings to regulate what the transmit .

Also, when transmitting, set the meter to read ALC, set RF Output to 90 watts and regulate output with the volume slider from the Output Volume selection from the configuration menu of MixW. Set the output power by raising the volume slider until the first ALC bar lights, then back it back down slightly. If the output is much above 45 watts at this point, regulate it down using the RF Power menu selection. The most important thing is not to generate an ALC signal. That indicates the audio (tones) going out are too "hot". Never run the processor.

I am sure others can offer more from actual experience.

This is something many of us saw happen on USENET back in the late 80s/early 90s. Someone would discover X, discover the newsgroup for X, and post all sorts of newbie questions to the group.

The response was the invention of the FAQ, or "Frequently Asked Questions" file that got posted to various USENET newsgroups on a regular basis.

I don't have time to do this, but maybe someone else does -- create a FT897 FAQ that is both posted on the web and emailed to any person joining this list with a stern warning about asking questions before reading the FAQ. Things like, "What's the difference between X and Y" or "how do I change option ABC" go in the FAQ.

It goes without saying that the person who writes/maintains the FAQ gains serious karma points.

I'm considering the SignaLinkUSB to add digital modes to my FT897. I like the idea of it having it's own sound card, because this will keep the windows beeps and other sounds out of the transmit audio. How well does this unit work, were there any problems setting it up or using it?

18367. Re: Good bye...A suggestion instead

Yahoo group: FT897 (2007)
Date: 2007-04-12 03:12:23 UTC
From: robert goodman
Topic: 18351 Message: 18367

I agree...who wants all those emails. I belong to about 3 dozen Yahoo Groups and would be suffocated by all the emails from all those groups on top of the 2,000 emails I already get a day (97.2% filtered by Mailwasher). Instead, I don't get a single email from any of these Groups (individual hams, yes...groups, no.)

The solution?

1. Go to Home Page of Group
2. Look at top of page, right above where it says FT897
3. Click "Edit Membership"
4. Scroll to Step 2 on page
5. Click "Web Only"
6. Click "Save Changes"

Total elapsed time: 37 seconds.

* No more emails. Nada. Zip. Zero.
* Just log onto the Group when you have the time.
* Scan the last couple of pages of messages for anything of interest.
* If interested, read and/or participate.
* If need help with something, post.
* If not interested, log off and do something else.
* If not interested in anything this particular visit, total time to get caught up: 2 minutes, but only done when you have the time.

Problem sovled.

Wouldn't it be great if everything in life was that easy to solve?

One of the nice things about the way Yahoo does these groups: if you find a topic of interest, every response is nested at the bottom...so you can drill down as deep as the discussion goes...without having to scour pages of messages looking for follow up answers.

Just an idea...

Hi Richard,

I have one of the SignaLink USB interfaces...absolutely great gizmo.

I had its predecessor, the SL+1 which was very good....but the new one seems to work better from having better ears (since it has its own dedicated sound card)...but also you lose 3 cables...audio in, audio out and power source in exchange for one USB cable...makes things a lot simpler especially for taking with you for portable work.

Ok, thanks. I was doing some research on it and what I've read indicates that it is a good unit, well worth the cost. The other unit I was considering was the Rigblaster, but man, is it expensive.

I think I'll order a SignaLink tomorrow.

Subject: [FT897] Good bye...

It was nice... at the beginning.
But now i'm sick of "which one to buy", "í'm new on the group"and so on, and when a decent topic like boat antennas with a 897 shows up, someone is smart enough to state that it doesn't belong here.
So i wish you all good luck in explaining to those which don't bother to read older messages what the differences are between 897 and 857 and which one is better...

Regards,
Marius Petrescu, MD, YO2LOJ

From: Randy Charles Ford
Topic: 18351 Message: 18371

One of the many concepts from USENET that it would be nice to see is lurking. When I join a new group, I read many posts before jumping in and posting myself. Since old posts are available, lurking for a months can be accomplished in thirty minutes by looking through the monthly archives.

While Yahoo's searching ability is limited, one can still read subjects of the last couple of months to see if one's topic has been discussed recently. I don't think it is the once every six month's questions that really irritate people; it's the ones with a weekly or monthly frequency that are the irritant.

However, this post won't help this group because nobody is going to read it before jumping in with the same question that was asked last week. Hopefully though, some will consider lurking when they join another group.

I really wish groups like this were on USENET instead of mailing lists.

73, Randy - KG4JIX.

From: Lew Phelps K6LMP
Topic: 18351 Message: 18372

I would be willing to undertake at least a part of the proposed FAQ. I suggest that it could be split into several broad topic areas, with different members of the group taking ownership for each.

The prime candidate for FAQ discussion appears to be the differences between the 897 and the 897D, and between the 897 and 857. Having undertaken that analysis myself a year or so ago, before I bought an 897D, I think I can do that reasonably quickly and easily.

Other possible topics for discussion:
1. Batteries vs. internal power supply, etc.
2. Known Issues with 897D.
3. ????

I am not in a position to evaluate the 897 vs. Icom or other competitors' products. Frankly, I think the FAQ should strongly discourage postings along that line, since such choices are driven by (a) performance specifications and (b) personal preferences. Anyone who is about to invest a Kilobuck or so should be willing to do the research needed to deal with the former. The latter just clutters the list, as far as I am concerned.

Anyone out there willing to take on some of the other topics? I will (at least for the time being) volunteer to consolidate the FAQ document content, incorporate input and updates from others, etc.

I like the idea that any new member should be sent a copy of the FAQ when he joins; some people won't even know it exists, otherwise. The intro to the FAQ should urge new members to read it carefully, and NOT post questions on the topics addressed in the FAQ. I would add a strong admonition to RTFM.

I would also be willing to help with a FAQ. A couple more questions are
Is the FT-897 a good radio for me? This question can normally be answered with an explanation of the features that make this radio unique and an understanding that it does everything but isn't a base station radio.
How does the ft-897 compare to the IC-7000.
I bought the stock tuner and it won't tune my random wire.
I installed the crystal and it doesn't work, is it upside down?
How do I use PSK or other digital modes?

18375. No audio on FM broadcast band

Yahoo group: FT897 (2007)
Date: 2007-04-12 13:51:29 UTC
From: w0qfc
Topic: 18375 Message: 18375

I had the FT-897D disconnected for several days while doing some shack rewiring.
Now, after hooking everything back up, I have no audio on the Fm broadcast band. (Every other frequency has audio).
I have checked the FAQ's and the manual but can not find anything regarding this problem.
Any ideas from the group?
Tks es 73,

From: Michael Yancey
Topic: 18351 Message: 18376

A FAQ would be great.

I agree there are a lot of 'which should I choose'... and
'FT-897 vs (other brand...)'.

I don't know why someone would go to an 'affinity' group
to determine what they'd like to buy. I only came here
AFTER I had decided on the FT-897 (after the usual
comparisons - eHam reviews, some trusted Elmers who
OWNED or HAD OWNED the rig, comparing the specs
with other makes/models, reading ARRL lab report).

I mean - wouldn't that be like showing up to a
Volkswagon Club meeting and asking members 'should
I buy a VW or should I buy a Ford / Chrysler / Nissan?'.

Sorry to see someone leave. This group and the files and
archived messages has been very useful to me.

18377. RE FAQ Was Re: Good bye...

Yahoo group: FT897 (2007)
Date: 2007-04-12 14:06:39 UTC
From: dalite01@bellsouth.net
Topic: 18351 Message: 18377

Another point for the FAQ will be setting up SSB audio.

Mic setting should never be above 20 and processor should be avoided (if you want to achieve natural sound). It is actually an audio flat-top circuit that attempts to compress audio that is usually already carrying at or near 100% info, and results in loss of intelligibility. External Speech processing options could be covered. I plan on trying a W2IHY Audio EQ and Noise Gate with the FT-897 as soon as I find a Yaesu 8 pin round connector Mic to feed into it. I already have the cable to go to the rig for it.

Also, use of DSP Mic EQ and DSP processing level for EQ.

Additionally, how to force the remote touchtone Mic sound less offensive.

The mod collection in the file area (dg2iaq_modification_sheet_yaesu_ft_897.pdf) covers some of the technical reasons for the poor "hollow" audio inherit in the FT897 (and FT-857). I have one of each...

I have spent a few days trying to get objective audio reports and compile a group of menu settings that are good for my installation that I will be glad to share.

I plan to work with the MFJ 1279M Soundcard interface and sound card modes; especially MT-63 using MixW. I will also be glad to try to compile some info on using the FT-897 for Soundcard based digital modes.

Possible suggestions:

All contributions for FAQ have simply Subject:(no space)FAQ(space)hyphen(space)subject

E.G. Subject Line:FAQ - SSB Audio

This will help those using the search engine to quickly find threads pertaining to item of interest. This will help to quickly find info. The lack of leading space after the colon in subject line will lessen the chance of search engine stumbling and returning partial results.

Just random thoughts.

18378. Memory - What gets stored

Yahoo group: FT897 (2007)
Date: 2007-04-12 14:15:51 UTC
From: Curt Givens
Topic: 18378 Message: 18378

I've read through the manual on memory operation and it really does a good job of explaining how to store the settings, but it doesn't really say what all is stored. For instance right now I'll be hooking my rig blaster up for sound card modes using the mic for input. Once I get frequency, mode etc stored and get the power, mic gain et all set will all of that go into the memory when I store it. It would be nice to set up a memory location to say do BPSK31 and have the radio set to go when I choose that location.

18379. FT-897 Wiki instead of Yahoo?

Yahoo group: FT897 (2007)
Date: 2007-04-12 14:41:04 UTC
From: NØMTH, Pete
Topic: 18351 Message: 18379

As anyone pursued the idea of using a Wiki like site for this instead? It seems everyone has had their own little experiences and tweaks that I find to be very helpful, but the group seems to have grown at a such a rapid pace that we seem to rehash reoccurring topics once every month or so. Trying to find a small useful but obscure reference after it's been discussed is not easy.

Why put this burden on a small group of volunteers? Why not put something together that we ALL could be responsible for? <grin>

As mentioned by a few others on this group, the "Spirit of Ham Radio" would suggest that we would best serve ourselves that way.

Perhaps we've reached a threshold using the Yahoo! group. I don't know. I have my settings for the group just email me every-time something comes in. I never go out to the web to look at anything other then documentation or images. I find the subject lines to be accurate enough for me to say grab a group of messages regarding a topic I'm not interested in and dump them.

We could also include the images into articles by using a Wiki like format.

I could set up a test server at home using Linux and perhaps TWiki http://twiki.org/ and if a few people want to test it out, we could do that. Then, if its something that everyone might be okay with, I'd be willing to donate the web-space and domain name for the first two years ~$166 thru my current hosting service.

Thoughts?

Pete, NØMTH

Bravo, Pete!

The Yahoo group service totally sucks. It litters each email with ads and other junk. The search of archives is klunky. And I am always suspicious that it's a source of spam. Every time I sign up for a new group, I get a burst of junk from a new crop of spammers. Coincidence? I don't think so!

I think the FAQ would still be highly desirable, and my offer stands to participate in its creation, if the group would find it desirable even if we move to a Wiki site.

Topic: 18351 Message: 18381

I also did not join the group untill well after purchasing an 897 and
can only compare it to an Icom 728. Some may not want to be bothered
but I like the interaction. That is why I purchased the LDG z-11 pro
tuner and am pleased. I have learned quite a lot by just listening
(reading the posts). If I have a question, I hope to ask it.
Different people digest information differently. I could read
archived material and not see the forest for the trees. I know that
if I have an opinion about a subject, I will be glad to put my two
cents worth in. I only hope someone else has the patience to help me
when I come into a problem. It is from ignorance and not stupidity.
Everyone here should look upon themselves as ELMERS. Be honored to
be that for someone else. I have been lucky to have known very good
people that put up with a lot of ignorant questions. As I will hope
to always do with the same patience.
Best ot all es 73

18383. Re: [FT897] FT-897 Wiki instead of Yahoo?

Yahoo group: FT897 (2007)
Date: 2007-04-12 15:42:24 UTC
From: NØMTH, Pete
Topic: 18351 Message: 18383

Well,

For those that aren't so computer inclined, it's very simply and all driven thru a web interface that we are already familiar with.

The client-side is platform independent as long as your browser supports HTML 3.2.

http://twiki.org/cgi-bin/view/TWiki04x01/ATasteOfTWiki

There is a "Start Presentation" button at the top of the page that might be helpful to those who have questions.

I certainly do not want to give the impression of "overtaking" the group from the moderators as they have done an excellent job keeping things in check. I think we've certainly reached a limitation of the Yahoo group. We would certainly still need leadership in this project and I look to the mentors for providing some good lessons, options, issues, and would like for them to contribute as much as they want. I'm merely offering this as another option for ALL of us to contribute to.

I'm just trying to figure out how we can ingest the information without making the articles into long threaded discussions or rants on something. The Wiki offers many ways of managing data.

I will get the basics of the server done hopefully this weekend and begin keeping a project plan on the front-end of the site to keep folks informed. I need to test out the TWiki software and see what other tweaks need to be done and whether the hosting company offers the components I need to do the install on the final server.

18386. An Ignorant Amplifier Question

Yahoo group: FT897 (2007)
Date: 2007-04-12 16:53:06 UTC
From: n5kwb
Topic: 18386 Message: 18386

Ok I admit being totally ignorant of this. I am looking into getting a SB 200 amp as I am a traffic handler, net control station and a net manager. I also realize you can't put a 100 watt tuner between the amp and the antenna. The question is, "If your antenna is resonate with a less than 1.5 to 1 swr on the net frequency, is it safe to leave the tuner in line between the radio and amplifier. I don't want to damage anything and is necessary, will adapt my station to remove the tuner from line when calling a traffic net. In my 20 plus years on the air, I have never faced this problem before but see it as coming up in the future. I have seen some high power auto tuners but will set me back a good bit and will take time to save up for. SSDI does not allow for many extras.

I think an FT-897D Wiki would be great - especially for new hams! It could graphically cover things like:

(1) Installations of audio interface devices like SignalLink +1 and others. Photographs would be of great help here.
(2) Internal batteries
(3) External / internal power supplies
(4) Different modes of operations
(5) List of top 10 or 20 most used menu commands
(6) "How To" guides
(7) Photos of 897s in use in shacks or portable

I am exasperated.....! I think a Wiki would be great! I will gladly contribute.

I agree with the FAQ suggestion, however, there are way too many questions that show up here that could be answered if the owner would READ THE DAMN MANUAL FIRST!!!!!!!!!!!!!!!!!!

How to turn on/off the running man, why is menu #XX not showing, etc. Those are all in the manual, if you took the time to read it (albeit, SLOWLY AND CAREFULLY!). In most instances, just perusing the manual page by page, SLOWLY, will get you to what you are looking for. I noticed that most manuals (regardless of radio manufacturer) do NOT have a true and complete index of information you may be looking for. The biggest reason you should read the manual (or at least leaf through it first) is because, at least with Yaesu, they have small "notes" areas on many pages that give you the info you are looking for and those "notes" are NOT placed into the index. So, just merely looking through the index will not help in most instances. Therefore, going through the manual, BEFORE JUMPING THE GUN AND POSTING A QUESTION HERE, WILL get you to the info you are seeking!

PAY ATTENTION TO THOSE "NOTES", THEY ARE EXTREMELY HELPFUL AND WILL HAVE THE INFO YOU ARE LOOKING FOR!!!!!!!!!!

It is VERY apparent that new owners will look through the index, not find what they are looking for, and then post a question here.

Most new radios today are no longer the "plug and play" type as was the case not too long ago. It used to be where you could simply take the radio out of the box, hook up power and antennas and be on the air in a few minutes. Today's radios require that you READ THE MANUAL, become familiar with at least the basic functions of the radio and consult the manual for more information on operating it. The biggest reason for this is the set up and layout of the menu system. I, as with many other hams I know, keep the manual handy for future reference because I will always forget something and need to look it up.

I keep both a PDF and the paper manual handy.

So, that said, PLEASE, READ AND PERUSE YOUR OWNERS MANUAL SLOWLY AND CAREFULLY FIRST. Then if you require further help, post your dilemma.

Thanks Dennis, I agree and I think the FAQ would help but not eliminate all new comers asking questions. However when they do ask routine questions any user in this group could respond please look at the FAQ question 7. When the look at the FAQ this may just point them to page 87 of the manual. This will also prompt them to look at the FAQ in the future instead of risking embarrassment again.

In my opinion a FAQ would greatly reduce traffic.

18390. RE: [FT897] No audio on FM broadcast band

Yahoo group: FT897 (2007)
Date: 2007-04-12 18:05:10 UTC
From: Patricia (Elaine) Gibbons
Topic: 18375 Message: 18390

Are you using any type of bandpass filter outboard of the radio, between the antenna and the VHF/UHF antenna port ???

I had a DCI dual-band 2-meter/440 MHz bandpass filter inline with my discone, and discovered that was why my radio didn't hear anything on the 88-108 MHz band ..

Elaine

From: FT897@yahoogroups.com [mailto:FT897@yahoogroups.com] On Behalf Of w0qfc

Subject: [FT897] No audio on FM broadcast band

I had the FT-897D disconnected for several days while doing some shack rewiring.
Now, after hooking everything back up, I have no audio on the Fm broadcast band. (Every other frequency has audio).
I have checked the FAQ's and the manual but can not find anything regarding this problem.
Any ideas from the group?

Tom:
I would think that the only point to leaving the tuner in the line between the radio and the amplifier is to use it when the amp is in bypass mode (not in use) and the frequency you're on is one where the antenna isn't quite resonant.
As for the hazzards, you are correct that you don't want a low power tuner located between the amp and the antenna, even if the tuner is in bypass mode when using the amp. The relay contacts in the tuner simply won't stand for that. I don't see any problems with it between the radio and the amp although you probably don't want to let it tune when the amp is in use. The amp input should present a reasonable load to the radio. The output tuning on the SB-200 amp should be quite capable of matching any reasonably resonant antenna, so unless you are trying to feed a non-resonant antenna, you don't need the tuner on the output of the amp. I think you'll find the SB-200 a good workhorse as long as it's in good condition.
Also, thanks for your service being a traffic handler, net control, and net manager.

Elaine: No outboard filters.

Kent:
(I also listen to Mozart)
Did a hard reset. Not sure what the proper bandwidth should be; the radio shows:

105.500.00
VFOa WFM
A/B A=B SPL

Question: How do you change the bandwidth!

Perhaps this problem is not "Ham" related, but it does have to do with the operation of the radio.
The strange part is that everything was working ok ~ it was off (No power) for several days ~ Then, when the radio was powered up again with no changes, no broadcast audio!

Maybe I should forget this new rig and just go back to the DX-40/HQ-140X!
